## **PRODUCT USER MANUAL**

**GPS ENGINE BOARD** 

ET-314

#### Features:

SiRF star high performance GPS Chip Set
Very high sensitivity (Tracking Sensitivity: -159 dBm)
Extremely fast TTFF (Time To First Fix) at low signal level
Compact size (25.4mm \* 25.4 mm \* 3.3mm) suitable for space-sensitive application
One size component, easy to mount on another PCB board
Support NMEA 0183 and SiRF binary protocol

## **Specification:**

| General            |                                     |
|--------------------|-------------------------------------|
|                    | SiRF Star                           |
| Chipset            |                                     |
| Frequency          | L1, 1575.42 MHz                     |
| C/A code           | 1.023 MHz chip rate                 |
| Channels           | 20 channel all-in-view tracking     |
| Sensitivity        | -159 dBm                            |
| Accuracy           |                                     |
| Position           | 10 meters, 2D RMS                   |
|                    | 5 meters, 2D RMS, WAAS enabled      |
| Velocity           | 0.1 m/s                             |
| Time               | lus synchronized to GPS time        |
| Datum              |                                     |
| Default            | WGS-84                              |
| Acquisition Time   |                                     |
| Reacquisition      | 0.1 sec., average                   |
| Hot start          | 1 sec., average                     |
| Warm start         | 38 sec., average                    |
| Cold start         | 42 sec., average                    |
| Dynamic Conditions |                                     |
| Altitude           | 18,000 meters (60,000 feet) max     |
| Velocity           | 515 meters /second (1000 knots) max |
| Acceleration       | Less than 4g                        |
| Jerk               | 20m/sec **3                         |
|                    |                                     |

## Power

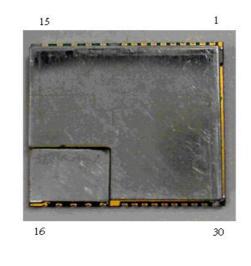

| Main power input  | 3.3V +- 5% DC input    |
|-------------------|------------------------|
| Power consumption | 68mA (Continuous mode) |

## Interface

| Dimension      | 25.4mm * 25.4 mm * 3.3mm               |
|----------------|--|
| Baud rate      | 4,800 to 57,600 bps adjustable         |
| Output message | SiRF binary or                         |
|                | NMEA 0183 GGA, GSA, GSV, RMC, VTG, GLL |

## GPS Antenna Specification(Recommendation)

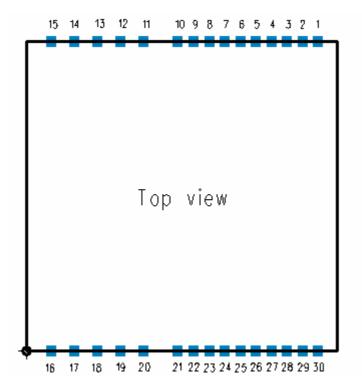

| Frequency: 1575.42+2 MHz        |
|---------------------------------|
| Axial Ratio: 3 dB Typical       |
| output Impedance: 50Ω           |
| Polarization: RHCP              |
| Amplifier Gain :20~26dB Typical |
| Output VSWR: 2.0 Max.           |
| Noise Figure: 2.0 dB Max.       |

**Environmental** Operating Temp

-40 to +85

## Pin Assignment

| Pin      | Signal Name | I/O | Description                 |
|----------|-------------|-----|-----------------------------|
| 1        | VCC         | Ι   | DC Supply Voltage input     |
| 2        | GND         | G   | Ground                      |
| 3        | Boot select | Т   | Boot mode                   |
| 4        | RXA         | Ι   | Serial port A               |
| 5        | TXA         | 0   | Serial port A               |
| 6        | ТХВ         | 0   | Serial port B               |
| 7        | RXB         | Ι   | Serial port B               |
| 8        | GPIO14      | I/O | General –purpose I/O        |
| 9        | RF_ON       |     |                             |
| 10       | GND         | G   | Digital Ground              |
| 11<br>16 | GND_A       | G   | Analog Ground               |
| 17       | RF_IN       | I   | GPS Signal input            |
| 18       | GND_A       | G   | Analog Ground               |
| 19       | V_ANT_IN    | Ι   | Active Antenna Bias voltage |
| 20       | VCC_RF      | 0   | Supply Antenna Bias voltage |
| 21       | V_BAT       | Ι   | Backup voltage supply       |
| 22       | Reset       | Ι   | Reset (Active low)          |

| 23 | GPIO10 | I/O | General purpose I/O   |
|----|--------|-----|---|
| 24 | GPIO1  | I/O | General purpose I/O   |
| 25 | GPIO5  | I/O | General purpose I/O   |
| 26 | GPIO0  | I/O | General purpose I/O<br>(support continuous power mode only) |
| 27 | GPIO13 | I/O | General purpose I/O   |
| 28 | GPIO15 | I/O | General purpose I/O   |
| 29 | PPS    | 0   | One pulse per second  |
| 30 | GND    | G   | Digital Ground  |

## **Definition of Pin assignment**

#### VCC

This is the main DC supply for a 3.3V + 5% DC input power module board.

#### GND

GND provides the ground for digital part.

#### **Boot select**

Set this pin to high for programming flash.

#### RXA

This is the main receiver channel and is used to receive software commands to

the board from SIRFdemo software or from user written software.

PS: Pull up if not used.

#### RXB

This is the auxiliary receiving channel and is used to input differential

corrections to the board to enable DGPS navigation.

PS: Pull up if not used.

### ТХА

This is the main transmitting channel and is used to output navigation and measurement data to SiRFdemo or user written software.

#### ТХВ

For user's application (not currently used). **RF\_ON** 

This pin indicates state of RF voltage.

#### **RF\_IN**

This pin receiver signal of GPS analog .due to the RF characteristics of the signal the design has to certain criteria. The line on the PCB from the antenna(or antenna connector) has to be a controlled microstrip line at 50

#### V\_ANT\_IN

This pin is reserved an external DC power supply for active antenna. If using 3.0V active antenna, pin 19 has to be connected to pin 20. If using 3.3V or 12V active antenna, this pin has to be connected to 3.3V or 5V

power supply.

## VCC\_RF

This pin provides DC voltage 3.0 for active antenna. Reset

This pin provides an active-low reset input to the board. It causes the board to

reset and start searching for satellites. If not utilized, it may be left open.

#### PPS

This pin provides one pulse-per-second output from the board, which is synchronized to GPS time. This is not available in Trickle Power mode.

#### Backup battery (V\_BAT)

This is the battery backup input that powers the SRAM and RTC when main power is removed. Typical current draw is 15uA. Without an external backup battery, the module/engine board will execute a cold star after every turn on. To achieve the faster start-up offered by a hot or warm start, a battery backup must be connected. The battery voltage should be between 2.0v and 5.0v. Without an external backup battery or super cap, the TMP will execute a cold start after every power on. To achieve the faster start-up offered by a hot or warm start, either a battery backup must be connected or a super cap installed.

To maximize battery lifetime, the battery voltage should not exceed the

supply voltage and should be between 2.5V and 3.6V.

With the super cap (B1) installed, and after at least ten minutes of

continuous operation, the data retention is about seven hours.

Note that even though all other components are rated at -30 to +85 deg C, a

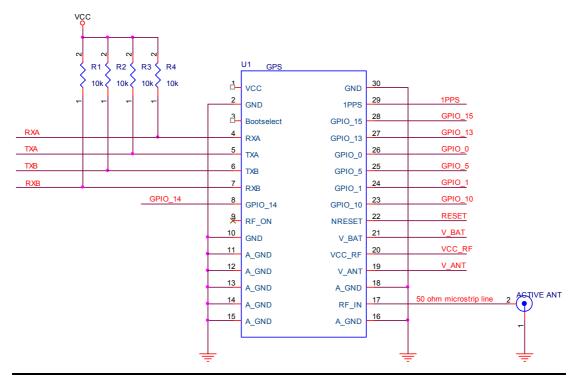

typical super cap is specified over a temperature range of -25 to +70 deg C

and a typical rechargeable Lithium battery is over -20 to +70 deg C.

#### **GPIO Functions**

Several I/Os are connected to the digital interface connector for custom applications.

#### **Application Circuit**

#### (1) Ground Planes:

ET-314 GPS receiver needs two different ground planes. The GND\_A pin(11, 12, 13, 14, 15, 16, 18) shall be connect to analog ground. The GND pin(2, 10, 30) connect to digital ground.

(2) Serial Interface:

The Serial interface pin(RXA, TX1, TXB, RXB) is recommended to pull up(10K). It can increase the stability of serial data.

(3) Backup Battery:

It's recommended to connect a backup battery to V\_BAT.

In order to enable the warm and hot start features of the GPS receiver. If you

don't intend to use a backup battery, connect this pin to GND or open.

If you use backup battery, shall need to add a bypassing capacitor (10uF) at

V\_bat trace. It can reduce noise and increase the stability.

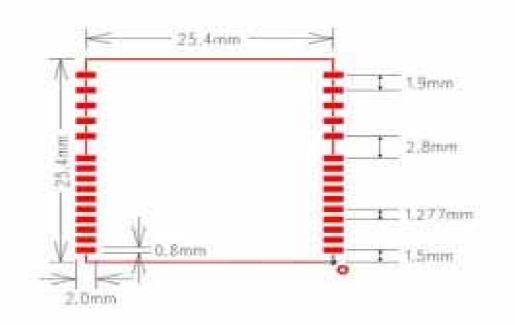

(4) Antenna:

Connecting to the antenna has to be routed on the PCB. The transmission line must to controlled impedance to connect RF\_IN to the antenna or antenna connector of your choice.

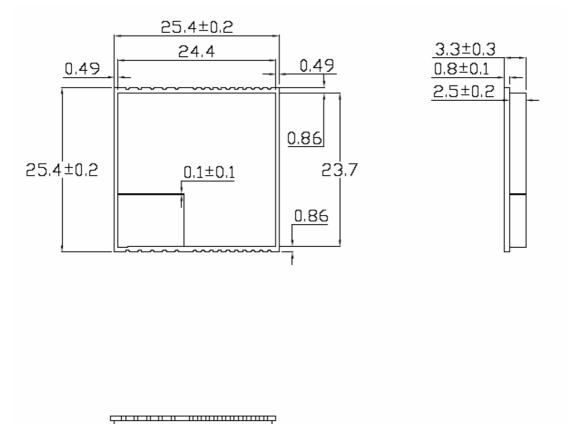

(5) Active antenna bias voltage:

The Vcc\_RF pin (pin 20) is providing voltage 3.3V. If you use active antenna, you can connect this pin to V\_ANT\_IN pin (pin 19) to provide bias voltage of active

#### 2.2 NMEA Input Command

#### A). Set Serial Port ID:100 Set PORTA parameters and protocol

This command message is used to set the protocol(SiRF Binary, NMEA, or USER1) and/or the communication parameters(baud, data bits, stop bits, parity). Generally,this command would be used to switch the module back to SiRF Binary protocol mode where a more extensive command message set is available. For example,to change navigation parameters. When a valid message is received,the parameters will be stored in battery backed SRAM and then the receiver will restart using the saved parameters.

#### Format:

\$PSRF100,<protocol>,<baud>,<DataBits>,<StopBits>,<Parity>\*CKSUM

| <protocol></protocol> | 0=SiRF Binary, 1=NMEA, 4=USER1                |
|-----------------------|---|
| <baud></baud>         | 1200, 2400, 4800, 9600, 19200, 38400          |
| <databits></databits> | 8,7. Note that SiRF protocol is only valid f8 |
|                       | Data bits                                     |
| <stopbits></stopbits> | 0,1   |
| <parity></parity>     | 0=None, 1=Odd, 2=Even                         |

Example 1: Switch to SiRF Binary protocol at 9600,8,N,1 \$PSRF100,0,9600,8,1,0\*0C<CR><LF>

Example 2: Switch to User1 protocol at 38400,8,N,1 \$PSRF100,4,38400,8,1,0\*38<CR><LF>

> \*\*Checksum Field: The absolute value calculated by exclusive-OR the 8 data bits of each character in the Sentence, between, but excluding "\$" and "\*". The hexadecimal value of the most significant and least significant 4 bits of the result are converted to two ASCII characters (0-9,A-F) for transmission. The most significant character is transmitted first.

\*\*<CR><LF> : Hex 0D 0A

## **B).** Navigation Initialization ID: 101 Parameters required for

#### start

This command is used to initialize the module for a warm start, by providing current position (in X, Y, Z coordinates), clock offset, and time. This enables the receiver to search for the correct satellite signals at the correct signal parameters. Correct initialization parameters will enable the receiver to acquire signals more quickly, and thus, produce a faster navigational solution.

When a valid Navigation Initialization command is received, the receiver will restart using the input parameters as a basis for satellite selection and acquisition.

#### Format :

\$PSRF101,<X>,<Y>,<Z>,<ClkOffset>,<TimeOfWeek>,<WeekNo>,<chnlCount>,<R
esetCfg>

\*CKSUM<CR><LF>

| <x></x>                   | X coordinate position                         |  |  |
|---------------------------|---|--|--|
|                           | INT32   |  |  |
| <y></y>                   | Y coordinate position                         |  |  |
|                           | INT32   |  |  |
| <z></z>                   | Z coordinate position                         |  |  |
|                           | INT32   |  |  |
| <clkoffset></clkoffset>   | Clock offset of the receiver in Hz, Use 0 for |  |  |
|                           | last saved value if available. If this is     |  |  |
|                           | unavailable, a default value of 75000 for     |  |  |
|                           | GSP1, 95000 for GSP 1/LX will be used.        |  |  |
|                           | INT32   |  |  |
| <timeof week=""></timeof> | GPS Time Of Week                              |  |  |
|                           | UINT32  |  |  |
| <weekno></weekno>         | GPS Week Number                               |  |  |
|                           | UINT16  |  |  |
|                           | ( Week No and Time Of Week calculation        |  |  |
|                           | from UTC time )                               |  |  |
| <chnlcount></chnlcount>   | Number of channels to use.1-12. If your       |  |  |
|                           | CPU throughput is not high enough, you        |  |  |

could decrease needed throughput by reducing the number of active channels UBYTE

<ResetCfg> bit mask 0×01=Data Valid warm/hotstarts=1 0×02=clear ephemeris warm start=1 0×04=clear memory. Cold start=1 UBYTE

Example: Start using known position and time.

**\$** PSRF101,-2686700,-4304200,3851624,96000,497260,921,12,3\*7F

#### C). Set DGPS Port ID:102 Set PORT B parameters for DGPS input

This command is used to control Serial Port B that is an input only serial port used to receive

RTCM differential corrections.

Differential receivers may output corrections using different communication parameters.

The default communication parameters for PORT B are 9600

Baud, 8data bits, 0 stop bits, and no parity.

If a DGPS receiver is used which has different communication parameters, use this command to allow the receiver to correctly decode the data. When a valid message is received, the parameters will be stored in battery backed SRAM and then the receiver will restart using the saved parameters.

Format:

\$ PSRF102,<Baud>,<DataBits>,<StopBits>,<Parity>\*CKSUM<CR><LF>

| <baud></baud>         | 1200,2400,4800,9600,19200,38400 |
|-----------------------|---------------------------------|
| <databits></databits> | 8                               |
| <stopbits></stopbits> | 0,1                             |
| <parity></parity>     | 0=None,Odd=1,Even=2             |

Example: Set DGPS Port to be 9600,8,N,1 \$PSRF102,9600,8,1.0\*12

# D). Query/Rate Control ID:103 Query standard NMEA message and/or set output rate

This command is used to control the output of standard NMEA message GGA, GLL, GSA, GSV

RMC, VTG. Using this command message, standard NMEA message may be polled once, or setup for periodic output. Checksums may also be enabled or disabled depending on the needs of the receiving program. NMEA message settings are saved in battery backed memory for each entry when the message is accepted.

#### Format:

\$ PSRF103,<msg>,<mode>,<rate>,<cksumEnable>\*CKSUM<CR><LF>

<msg> 0=GGA,1=GLL,2=GSA,3=GSV,4=RMC,5=VTG <mode> 0=SetRate,1=Query <rate> Output every <rate>seconds, off=0,max=255 <cksumEnable> 0=disable Checksum,1=Enable checksum for specified message

Example 1: Query the GGA message with checksum enabled \$ PSRF103,00,01,00,01\*25

Example 2: Enable VTG message for a 1Hz constant output with checksum enabled \$PSRF103,05,00,01,01\*20

Example 3: Disable VTG message \$ PSRF103,05,00,00,01\*21

# E). LLA Navigation Initialization ID:104 Parameters required to start using Lat/Lon/Alt

This command is used to initialize the module for a warm start, by providing current position (in Latitude, Longitude, Altitude coordinates), clock offset, and time. This enables the receiver to search for the correct satellite signals at the correct signal parameters. Correct initialization parameters will enable the receiver to acquire signals more quickly, and thus, will produce a faster navigational soution.

When a valid LLANavigationInitialization command is received, the receiver will restart using the input parameters as a basis for satellite selection and acquisition.

Format:

```
$ PSRF104,<Lat>,<Lon>,<Alt>,<ClkOffset>,<TimeOfWeek>,<WeekNo>,
<ChannelCount>, <ResetCfg>*CKSUM<CR><LF>
```

| <lat></lat>                   | Latitude position, assumed positive north of equator and<br>negative south of equator float, possibly signed                      |
|-------------------------------|---|
| <lon></lon>                   | Longitude position, it is assumed positive east of Greenwich<br>and negative west of Greenwich<br>Float, possibly signed          |
| <alt></alt>                   | Altitude position<br>float, possibly signed   |
| <clkoffset></clkoffset>       | Clock Offset of the receiver in Hz, use 0 for last saved value if available. If this is unavailable, a default value of 75000 for |
|                               | GSP1, 95000 for GSP1/LX will be used.<br>INT32  |
| <timeofweek></timeofweek>     | GPS Time Of Week<br>UINT32  |
| <weekno></weekno>             | GPS Week Number<br>UINT16   |
| <channelcount></channelcount> |   |

<ResetCfg> bit mask 0×01=Data Valid warm/hot starts=1 0×02=clear ephemeris warm start=1 0×04=clear memory. Cold start=1 UBYTE Example: Start using known position and time. \$ PSRF104,37.3875111,-121.97232,0,96000,237759,922,12,3\*37

## F). Development Data On/Off ID:105 Switch Development Data Messages On/Off

Use this command to enable development debug information if you are having trouble getting commands accepted. Invalid commands will generate debug information that should enable the user to determine the source of the command rejection. Common reasons for input command rejection are invalid checksum or parameter out of specified range. This setting is not preserved across a module reset.

Format: \$ PSRF105,<debug>\*CKSUM<CR><LF>

| <debug></debug>    | 0=Off,1=On      |
|--------------------|-----------------|
| Example: Debug On  | \$ PSRF105,1*3E |
| Example: Debug Off | \$ PSRF105,0*3F |

# G). Select Datum ID:106 Selection of datum to be used for coordinate Transformations

GPS receivers perform initial position and velocity calculations using an earth-centered earth-fixed (ECEF) coordinate system. Results may be converted to an earth model (geoid) defined by the selected datum. The default datum is WGS 84 (World Geodetic System 1984) which provides a worldwide common grid system that may be translated into local coordinate systems or map datums. (Local map datums are a best fit to the local shape of the earth and not valid worldwide.) Examples: Datum select TOKYO\_MEAN \$PSRF106,178\*32

| Name                | Example   | Units | Description                |
