SmartHeat® Technology

OK International is the original supplier of SmartHeat® Soldering Technology. SmartHeat® senses the exact thermal requirement for each solder joint and responds by delivering the precise amount of thermal energy required to create a reliable connection.

The result is a high degree of control without resorting to higher tip idle temperatures required by conventional heater process technologies. Consequently, the risk of component and board damage is minimized. This is especially important with the greater thermal demands required by lead-free applications.

SmartHeat® Soldering Technology = Variable Power / Fixed Temperature

◗ SmartHeat® tips and cartridges sense the load and instantly deliver the right amount of heat directly to the solder joint.

◗ The required solder joint temperature drives the heating process, as opposed to the idle tip temperature setting (as in a conventional iron).

◗ Operates at lower and safer temperatures. Power is delivered in proportion to the load. SmartHeat® technology eliminates overshoot.

◗ No calibration required - saves money and eliminates system down-time.

MX-5200 Dual Simultaneous
Soldering, Desoldering & Rework Systems

The MX-5200 Soldering, Desoldering and Rework Series has the same increased power and process control as the MX-5000 Series, now with dual-simultaneous ports.

For two users or single user with dual applications. The MX-5200 can be operated with two hand-pieces dynamically sharing the 80 watts output power based on demand adding even more application flexibility and speed.

Fast time-to-recovery. Delivers increased production rates and throughput no matter the application. The challenges of high mass components, multilayered boards and lead-free solders are seamlessly tackled by the MX-5200 super-charged power supply.

SmartHeat process control. The technology built-in every Metcal System means that soldering and rework are always performed at safe, controlled temperatures. Metcal users know that moderate fixed temperatures, where power is varied, provides the best assurance for a well controlled soldering and rework process.

TipSaver™ Workstand improves tip life as well as operator ergonomics. This "Auto-Sleep" Workstand reduces the power to the hand-piece when it is placed in the Metcal TipSaver™ Workstand. Reduction in power will substantially decrease tip oxidation, a major cause of reduced tip life.

Ergonomic Hand-pieces. The aluminium hand-pieces for soldering and rework provides a cooler, lighter weight and more comfortable feel for the operator. And, the Metcal UltraFine™ Hand-piece features a new generation of extremely fine diameter cartridges in a slim profiled handle. Both of these hand-pieces uniquely offer users a choice of three interchangeable grips.

ESD safe and features incoming AC ground monitoring circuitry. The AC (mains) ground monitor detects power line ground failure, immediately alerting the operator and shuting down the system. Only after the power line ground has been restored can the MX-5200 be restarted and soldering operations can be resumed.

Built-in power indication meter with digital display and bar graph that visually provides the operator with feedback on the status of the soldering operation. Whether using a large mass rework tip for QFPs or a fine-point soldering tip, the power indication meter is a valuable resource for making consistent, acceptable solder joints.

Four mode indicators:

Ready Mode: The hand-piece is removed from the workstand, ready for soldering or rework.

Power Mode: The hand-piece's tip is in contact with the load. The power indication meter provides graphical and numeric feedback on the system power output.

Sleep Mode : The hand-piece is at rest in the workstand; power is reduced to the hand-piece.

Powersave Mode: Power to the hand-piece is shut off. This programmable sleep feature allows an operator to set the desired time to cut off power to the hand-piece (from 10 to 120 min.).

MX-500 Dual Switchable Output
Soldering, Desoldering & Rework Systems

Metcal's MX-500 Soldering and Rework System has been reimagined, adding features and a new look to a bench top icon. The system utilizes SmartHeat® Technology, where each cartridge is equipped with a self-regulating heater which 'senses' its own temperature and closely maintains its pre-set idle temperature for the life of the heater-tip. The tip temperature is determined by the inherent metallurgical properties of the heater; no external adjustment or equipment is required. The MX-500 retains switchable dual port, 40W operation while introducing numerous new features in a new housing.

Key Features & Benefits

◗ A built in Net Power Meter which will display a graphical and numerical representation of the power applied to the cartridge.

◗ User Programmable PowerSave Mode: the time to enter PowerSave Mode is adjustable from 10 to 120 minutes.

◗ Ground Fault Interrupt: AC ground monitor detects power line ground failures and immediately alerts the operator and shuts down the system.

◗ Universal Power Supply: automatically senses the input line voltage and adjusts accordingly, which allows for worldwide operation without adaptors or a change in performance.

◗ Full compatibility with existing and previous MX upgrade kits, tip-cartridges, hand-pieces and accessories.

Dual and Hoof Cartridge Tips

The success of conduction soldering depends upon the availability and controlled flow of thermal energy into the connection during two critical phases – flux activation and intermetallic bond formation. Higher thermal demand applications such as microwave shields, heavy block type housing and tabbing, preheat applications, BGA removal as an alternative to convection, cell phone shields, and industrial lugs and leads require additional thermal energy during these critical phases.

To address these challenging applications, Metcal offers the MX-HPDC dual cartridge hand-piece with the MX-WHPDC workstand for use with the MX series power supplies, along with a new series of (5) SMTC dual-shaft cartridges. Dual shaft cartridges are available with 700 & 800 series heaters.

Concave Hoof Cartridges

Metcal is pleased to release our new Concave Hoof geometries to our family of rework cartridges.
The new cartridges consist of 2mm and 3mm geometrics in the SMTC and SxP series.
The concave hoof cartridges improve the drag soldering techniques as the concave face of the tip provides a reservoir of solder. These are ideal for drag soldering multi-lead devices.

Scorpion Rework System

The Scorpion Advanced Package Rework System ensures both accurate component placement and custom tailored reflow profiles in one user friendly, single platform rework system.

The challenges of array package rework, and the inability to easily inspect placement accuracy, call for a solution that allows for simultaneous viewing of Printed Circuit Board pads and component balls for accurate placement.

The Scorpion Rework System fills this need with quick, accurate placement through the use of an all new vision system employing dual image overlay technology. This new vision system features LED lighting both top and bottom for shadow-free component visualization and component alignment. The HD camera is ready to go out of the box.

The two-head design allows the Scorpion Rework System to be tailored to the users specific rework needs and allows precision alignment of the smallest BGAs, QFNs and Micro SMDs with the highest accuracy. The open-ended board holder fits a wide variety of large, small and odd-shaped boards while allowing precise positioning over the patented dual subzone preheater.

The standard auto-profile mode ensures fast and easy profile creation with a minimum of setup time. By selecting your temperature targets any operator can quickly and accurately create reflow profiles for a wide variety of boards, and then save them in memory for future use.

Source temperatures and time intervals can be modified "On-the-Fly", eliminating the need to wait for the current profile to terminate before modifications can be made. Precise solder joint temperatures are measured and displayed on a real time graphical display, thus providing the necessary data to accurately and easily establish the optimum reflow profile for each particular application within minutes.

APR-5000-XL/XLS
Advanced Package Rework System

The APR-5000-XL Advanced Package Rework System provides board capability with small board precision. This system performs precise, cost effective rework of the widest range of PCBs and component types, from large boards up to 24.5" x 24.5" (622mm x 622mm) to components down to 0.020" x 0.010" (0.5mm x 0.25mm).

The flexible APR-5000-XL System incorporates dual stage pre-heaters and has the thermal capacity and control to execute precise profiles of both large and small PCBs, delivering uniform temperature control horizontally, across the surface of PCBs up to 0.25" (6.35mm) thick, and vertically between the die and ball of the reworked component.

Motorized X,Y, Z adjustments speed placement and help ensure process repeatability. In addition, motorized Theta axis provides 360° rotation to simplify component orientation. Together, these advanced controls reduce operator fatigue, improve placement accuracy and provide process repeatability.

Featured on the APR-5000-XL Advanced Package Rework System is an innovative Split Vision System, which allows operators to view the opposite corners of a component, including splitting on rectangular components, with the necessary magnification to make its placement and registration fast and accurate.

Features

■ New dual simultaneously operating subzones provides additional power for faster and safer rework operations.
■ New software enables fast and easy profiling
■ New dual subzone design speeds up the process while allowing the operating temperatures to remain lower protecting the component and PCB

Key benefits

■ Increased Productivity
■ Precise thermal control across critical assembly regions
■ Reduction of rework cycle time protects the component under rework from thermal damage.
■ Better management of the narrow lead-free process window without reaching excessive peak temperatures that damage components, connectors, other solder joints and the PCB substrate

Accessories

Component Stenciling Templates

Metcal has designed a unique tool, Component Stenciling Templates, for printing on the underside of components. This easy procedure is designed for use on PBGA, CBGA, CSP balled devices as well as Land Grid Array (LGA) components. This is an ideal process for small components and situations where traditional stencil access is limited by the close proximity of adjacent components.

Dip Transfer

This process involves dipping a component into gel flux, depositing an exact amount of flux. This process is quick, consistent and clean, and negates the need to clean after reflow. Available for both solder balled and leaded devices. All kits are supplied with a metal spatula. Ideally select a dip plate that is half the diameter of the solder balls on components.

Tape Feeder

Picking up small surface mount components with tweezers is not practical and may damage the component. This is a unique way of presenting small components to a rework machine.

Nozzles

A comprehensive range of standard reflow nozzles available to suit the most common array packages is available. The reflow nozzle works with vacuum pickup. The tweezer nozzle works with devices with limited pick up area or multilayer structure by providing mechanical tweezer action pickup instead of vacuum pickup e.g. PoP, sockets, connectors, inductors, potentiometers and through-hole components.

Replaceable Rubber Tips

The RT10 rubber tip, used with the Scorpion fine placement head, offers outstanding quality and performance features. The pick-up tip has a relieved tip surface, which minimizes surface contact with the component. Precision tolerances of +/-0.025 to 0.050mm ensure a repeatable setup when changing tips, while embossed code numbers help line personnel with identification and control. Together with proprietary ultra-pure and antistatic rubber, the RT10 tip is ideal for component attachment.

HCT2-120 Digital Hot Air Pencil

The HCT2-120 Hot Air Pencil is the latest addition to Metcal's offering of convection rework tools. This digital handheld convection tool is **ideally suited for light rework applications, which use smaller components and integrated circuits.**

As component miniaturization continues (i.e. 01005 components) the ergonomics of a pencil allow a user more freedom to access and rework components on the board without affecting adjacent parts. Larger hand-held convection systems commonly reflow and dislodge adjacent components due to a higher minimum airflow.

The HCT2-120's small nozzle sizes and precise and controllable airflow and temperature allow the operator to target only the desired component.

Key Features & Benefits

◗ 120 Watt Ceramic Heater and Dual Stage Air Pump: Provides the power and performance needed to deliver the right amount of thermal energy.

◗ Digital Airflow and Temperature Controls: Two LED displays provide a graphical and numerical representation of the desired airflow and temperature.

◗ Fast Response and Performance: A microprocessor controlled, closed loop feedback system provides fast heating, precise and stable temperature control.

◗ Standby Mode: When the hand-piece is placed into the workstand, the temperature will drop increasing heater life.

◗ Universal Power Supply: Automatically senses the input line voltage and adjusts accordingly, which allows for worldwide operation without adaptors or a change in performance.

◗ Ergonomic and Light Weight Hand-Piece that feels like a pencil, with a rubber grip. Increases operator comfort

◗ Nozzles: Six nozzles (1.5 mm – 4.0 mm) are included in the unit with a nozzle holder inside the workstand.

◗ Easily Change Heaters and Nozzles: Both can be changed in seconds, as shown below:

# HCT2-120 Digital Hot Air Pencil

Applications

The HCT2-120 was developed for very small surface mount component sizes (1206's and smaller) and low board densities. For denser PCBA's or applications with heavy copper planes; boards >4 layers; or components larger than 5mm², use of a Metcal preheater (see pages 51 and 52) may be necessary.
