# S2-LP

Datasheet

## Ultra-low power, high performance, sub-1 GHz transceiver

| Maturity status link |
| --- |
| S2-LP |

## Features

- Frequency bands:
  - 413-479 MHz (S2-LPQTR)
  - 452-527 MHz (S2-LPCBQTR)
  - 826-958 MHz (S2-LPQTR)
  - 904-1055 MHz (S2-LPCBQTR)
- Modulation schemes:
  - 2(G)FSK, 4(G)FSK
  - OOK, ASK
- Air data rate from 0.1 to 500 kbps
- Ultra-low power consumption:
  - 7 mA RX
  - 10 mA TX @ +10 dBm
- Excellent performance of receiver sensitivity: down to -130 dBm
- Excellent receiver selectivity and blocking
- Programmable RF output power up to +16 dBm
- Programmable RX digital filter
- Programmable channel spacing
- Fast start-up and frequency synthesizer settling time
- Automatic frequency offset compensation, AGC and symbol timing recovery
- More than 145 dB RF link budget
- Battery indicator and low battery detector
- RX and TX 128 bytes FIFO buffers
- 4-wire SPI interface
- Automatic packet acknowledgment and retransmission
- Embedded timeout protocol engine
- Excellent receiver selectivity (> 80 dB @ 2 MHz)
- ST companion integrated balun/filter chips are available
- Antenna diversity algorithm
- Fully integrated ultra-low power RC oscillator
- Wake-up driven by internal timer or external event
- Digital real time RSSI
- Flexible packet length with dynamic payload length
- Programmable preamble and SYNC word quality filtering and detection
- Embedded CSMA/CA engine based on listen-before-talk systems
- IEEE 802.15.4g hardware packet support with whitening, FEC, CRC and dual SYNC word detection
- Wireless M-BUS supported
- KNX-RF supported
- Enables operations in the SIGFOX™ and MONARCH networks

- Suitable to build systems targeting:
  - **Europe**: ETSI EN 300 220, category 1.5 natively compliant, ETSI EN 303 131
  - **US**: FCC part 15 and part 90
  - **Japan**: ARIB STD T67, T108
  - **China**: SRRC
- Operating temperature range: -40 °C to +105 °C

## Applications

- Sensors to Cloud
- Smart metering
- Home energy management systems
- Wireless alarm systems
- Smart home
- Building automation
- Industrial monitoring and control
- Smart lighting systems

# 1 Description

The S2-LP is a high performance ultra-low power RF transceiver, intended for RF wireless applications in the sub-1 GHz band. It is designed to operate in both the license-free ISM and SRD frequency bands at 433, 512, 868 and 920 MHz, but can also be programmed to operate at other additional frequencies in the 413-479 MHz, 452-527 MHz, 826-958 MHz, 904-1055 MHz bands.

The S2-LP supports different modulation schemes: 2(G)FSK, 4(G)FSK, OOK and ASK. The air data rate is programmable from 0.1 to 500 kbps.

The S2-LP can be used in systems with channel spacing down to 1 kHz enabling the narrow band operations.

The S2-LP shows an RF link budget higher than 140 dB for long communication ranges and meets the regulatory requirements applicable in territories worldwide, including Europe, Japan, China and the USA.

# 2 Detailed functional description

The S2-LP integrates a configurable baseband modem with proprietary fully programmable packet format allowing also:

- IEEE 802.15.4g applications
  - The hardware packet supports whitening, CRC, FEC and dual SYNC word detection.
- Wireless M-Bus applications

In order to reduce the overall system power consumption and increase the communication reliability, the S2-LP provides an embedded programmable automatic packet acknowledgment, automatic packet retransmission, CSMA/CA engine, low duty cycle protocol, RX sniff mode and timeout protocol.

The S2-LP fully supports antenna diversity with an integrated antenna switching control algorithm.

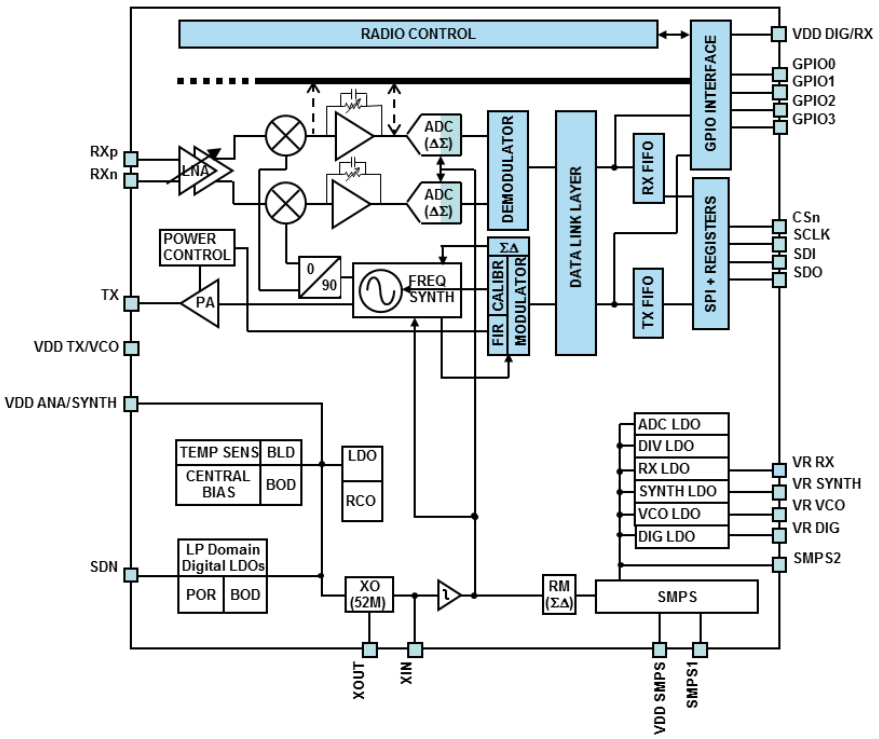
Transmitted/received data bytes are buffered in two different 128 bytes FIFOs (TX FIFO and RX FIFO), accessible via SPI interface for host processing.

In addition, the reduced number of external components enables a cost effective solution permitting a compact PCB footprint.

The S2-LP targets volume applications like:

- Sensors to Cloud
- Smart metering
- Home energy management systems
- Wireless alarm systems
- Smart home
- Building automation
- Industrial monitoring and control

**Figure 1. Simplified S2-LP block diagram**



The receiver architecture is low-IF conversion, the received RF signal is amplified by a two-stage low-noise amplifier (LNA) and down-converted in quadrature (I and Q) to the intermediate frequency (IF). LNA and IF amplifiers make up the RX front-end (RXFE) and have programmable gain. At IF, the ADCs digitalize the I/Q signals. The demodulated data go to an external MCU either through the 128-byte RX FIFO, readable via SPI, or directly using a programmable GPIO pin.

The transmitter part of the S2-LP is based on direct synthesis of the RF frequency. The power amplifier (PA) input is the LO generated by the RF synthesizer, while the output level can be configured between -30 dBm and +14 dBm (+16 dBm in boost mode), at antenna level with 0.5 dB steps.

The data to be transmitted can be provided by an external MCU either through the 128-byte TX FIFO writable via SPI, or directly using a programmable GPIO pin. The S2-LP supports frequency hopping, TX/RX and antenna diversity switch control, extending the link range and improving performance.

The S2-LP has a very efficient power management (PM) system. An integrated switched mode power supply (SMPS) regulator allows operation from a battery voltage ranging from +1.8 V to +3.6 V, and with power conversion efficiency of 90%.

A crystal must be connected between XIN and XOUT. It is digitally configurable to operate with different crystals. As an alternative, an external clock signal can be used to feed XIN for proper operation. The S2-LP also has an integrated low-power RC oscillator, generating the 34.7 kHz signal used as a clock for the slowest timeouts.

A standard 4-pin SPI bus is used to communicate with the external MCU. Four configurable general purpose I/Os are available.

# 3 Typical application diagram and pin description

This section describes three different application diagrams for the S2-LP. Two main configurations are available:

- HPM (high performance mode) configuration
- LPM (low power mode) configuration

In the LPM operating mode the LDOs are bypassed and the SMPS provides the regulator voltage at 1.2 V. Note that in LPM the PA is supplied from SMPS at 1.2 V (instead of 1.5 V as in HPM), so the max. output power is lower than HPM. The figure below shows the suggested configuration with discrete matching network and SMPS-ON.

**Figure 2. Suggested application diagram (embedded SMPS used)**

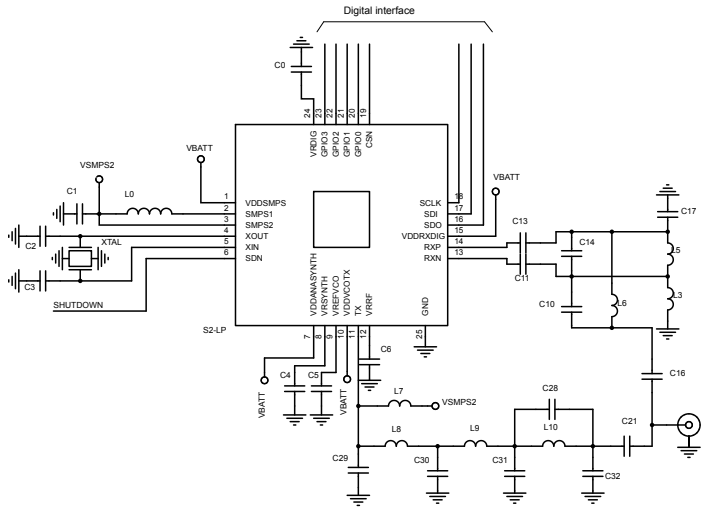


Figure 3. Suggested application diagram (embedded SMPS not used) shows the suggested configuration with discrete matching network and SMPS-OFF mode.

Figure 3. **Suggested application diagram (embedded SMPS not used)**

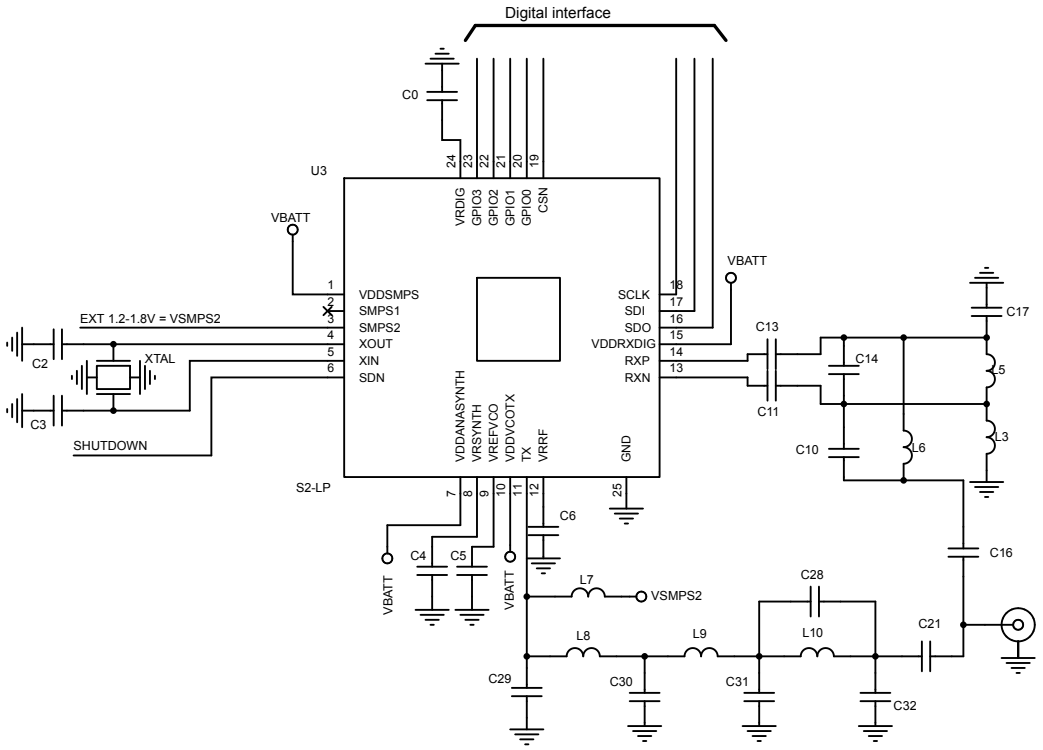

Figure 4. **Suggested application diagram HPM/LPM (integrated balun, embedded SMPS used)**

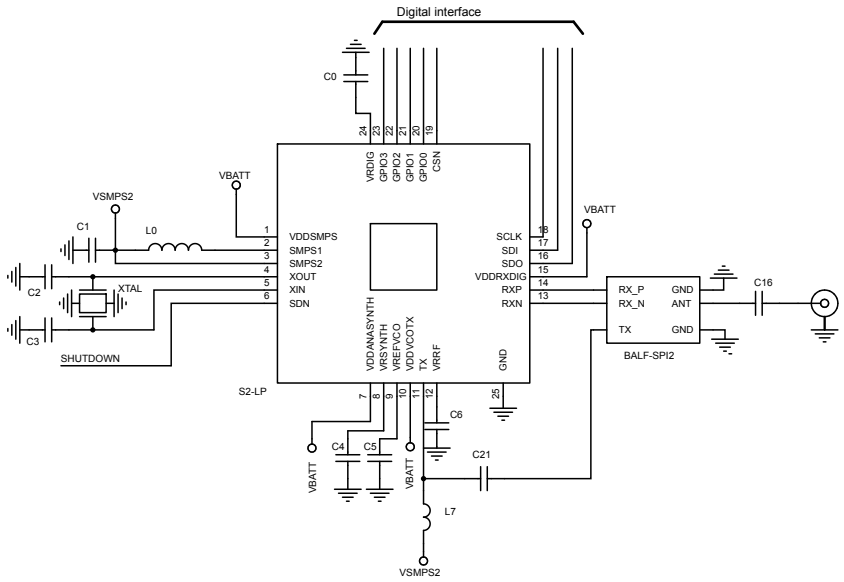

**Table 1. Description of the external components of the typical application diagrams**

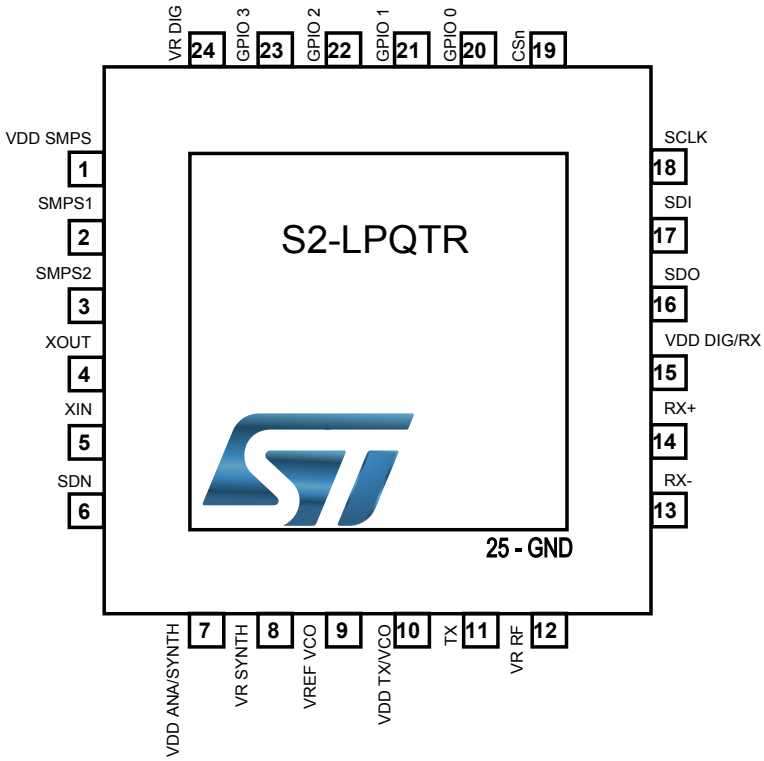
| Components | HPM/LPM discrete balun | | HPM/LPM integrated balun | Description |
|---|---|---|---|---|
| | SMPS ON | SMPS OFF | | |
| C0 | X | X | X | Decoupling capacitor for on-chip voltage regulator to digital part |
| C1 | X | - | X | SMPS LC filter capacitors |
| C2, C3 | X | X | X | Crystal loading capacitors |
| C4 | X | X | X | Decoupling capacitor for on-chip voltage regulator to synthesizer (LF part) |
| C5 | X | X | X | Decoupling capacitor for band-gap voltage reference of VCO regulator |
| C6 | X | X | X | Decoupling capacitor for on-chip voltage regulator to LNA-MIXER |
| C29, C30, C31, C32 | X | X | | TX LC filter/matching capacitors |
| C11, C13 | X | X | | DC blocking capacitors |
| C16, C21 | X | X | X | |
| C10, C14, C17 | X | X | | RF balun/matching capacitors |
| L0 | X | - | X | SMPS LC filter inductor |
| L7 | X | X | X | RF choke inductor or resonating inductor (upon RF network topology) |
| L8, L9, L10 | X | X | | TX LC filter/matching inductors |
| L3, L5, L6 | X | X | | RX balun/matching inductors |
| XTAL | X | X | X | Crystal |

## 3.1 Pin diagram

Figure 5. **Pin diagram, QFN24 (4x4 mm) package**



## 3.2 Pin description

Table 2. **Pinout**

| Number | Pin name | Pin type | Description |
|---|---|---|---|
| 1 | VDD SMPS | Power | 1.8 V to 3.6 V analog power supply for SMPS only. |
| 2 | SMPS1 | Analog out | 1.1 V to 1.8 V SMPS regulator output to be externally filtered |
| 3 | SMPS2 | Analog in | 1.1 V to 1.8 V SMPS voltage input after LC filtering applied to SMPS1 output |
| 4 | XOUT | Analog out | Crystal oscillator output. Connect to an external crystal or leave floating if driving the XIN pin with an external clock source |
| 5 | XIN | Analog in | Crystal oscillator input. Connect to an external crystal or to an external clock source. If using an external clock source, DC coupling with a minimum 0.2 VDC level is recommended and minimum AC amplitude of 400 mVpp (however, the instantaneous level at input cannot exceed the 0 – 1.4 V range) |
| 6 | SDN | Digital in | Shutdown input pin. SDN should be = ‘0’ in all modes, except shutdown mode |
| 7 | VDD ANA/ SYNTH | Power | 1.8 V to 3.6 V power |
| 8 | VR SYNTH | Analog in/out | 1.2 V SYNTH-LDO output for decoupling |
| 9 | VREF VCO | Analog out | 1.2 V VCO-LDO band-gap reference voltage decoupling |
| 10 | VDD VCO/TX | Power | 1.8 V to 3.6 V power supply |
| 11 | TX | RF output | RF output signal |

| Number | Pin name | Pin type | Description |
|---|---|---|---|
| 12 | VR RF | Analog in/out | 1.2 V RX-LDO output for decoupling |
| 13 | RXn | RF in | Differential RF input signals for the LNA |
| 14 | RXp | RF in | |
| 15 | VDD RX/DIG | Power | 1.8 V to 3.6 V power supply |
| 16 | SDO | Digital out | SPI slave data output |
| 17 | SDI | Digital in | SPI slave data input |
| 18 | SCLK | Digital in | SPI slave clock input |
| 19 | CSn | Digital in | SPI chip select |
| 20 | GPIO0 | Digital I/O | General purpose I/O that may be configured through the SPI registers to perform various functions |
| 21 | GPIO1 | Digital I/O | |
| 22 | GPIO2 | Digital I/O | |
| 23 | GPIO3 | Digital I/O | |
| 24 | VR DIG | Analog in/out | 1.2 V digital power supply output for decoupling |
| 25 | GND | Ground | Exposed pad connected to the ground of the application board |

# 4 Specifications

## 4.1 Absolute maximum ratings

Absolute maximum ratings are those values above which damage to the device may occur. Functional operation under these conditions is not implied. All voltages refer to GND.

**Table 3. Absolute maximum ratings**

| Parameter | Min. | Typ. | Max. | Unit |
|---|---|---|---|---|
| Supply and SMPS pins | -0.3 | | +3.9 | V |
| DC voltage on VREG pins | -0.3 | | +3.9 | |
| DC voltage on digital input pins | -0.3 | | +3.9 | |
| DC voltage on digital output pins | -0.3 | | +3.9 | |
| DC voltage on ground pins | -0.3 | | +3.9 | |
| DC voltage on analog pins | -0.3 | | +1.8 | |
| DC voltage on TX pin | -0.3 | | +3.9 | |
| Storage temperature range | -40 | | +125 | °C |
| VESD-HBM | | | 1000 | V |

## 4.2 Operating range

**Table 4. Operating range**

| Parameter | Min. | Typ. | Max. | Unit |
|---|---|---|---|---|
| Operating battery supply voltage ($V_{BAT}$) | 1.8(1) | 3.0 | 3.6 | V |
| Operating ambient temperature range | -40 | 25 | +105 | °C |

1. *2 V when the device works in boost mode with SMPS ON.*

## 4.3 Thermal properties

**Table 5. Thermal data**

| Parameter | QFN24 | Unit |
|---|---|---|
| Thermal resistance junction-ambient | 66 | °C/W |

## 4.4 Power consumption

Characteristics measured over recommended operating conditions unless otherwise specified. Typical values are referred to 25 °C temperature, $V_{BAT}$ = 3.3 V. All performance is referred to the STEVAL-FKI433V2 or STEVAL-FKI868V2 with a 50 Ohm antenna connector.

**Table 6. Low-power state power consumption**

| Parameter | Test conditions | Min. | Typ. | Max. | Unit |
|---|---|---|---|---|---|
| Supply current | Shutdown | - | 2.5 | - | nA |
| | Standby | | 500 | | |
| | Sleep | | 700 | | |
| | Sleep (FIFOs retained) | | 0.95 | | µA |
| | Ready | | 350 | | |

**Table 7. Power consumption in reception TA = 25 °C, VDD = 3.3 V, fc = 868 MHz**

| Parameter | Test conditions | Min. | HPM typ. | LPM typ. | Max. | Unit |
|---|---|---|---|---|---|---|
| Supply current | RX @ sensitivity level | | 8.6 | 7.2 | | mA |
| | RX in sniff mode @ 1.2 kbps (1) | | 0.9 | | | |
| | RX in sniff mode @ 38.4 kbps (2) | | 0.8 | | | |
| | RX in LDC mode @ 1.2 kbps (3) | - | 21 | | | µA |
| | RX in LDC mode @ 38.4 kbps (4) | | 3 | | | |

1. *Using 2-FSK, FREQDEV = 2.4 kHz, DR=1.2 kbps, 4 bytes preamble and 8 kHz ch. filter. Where the receiver wakes up at regular intervals to look for an incoming packet.*
2. *Using 2-FSK, FREQDEV = 20 kHz, DR=38.4 kbps, 24 bytes preamble and 100 kHz ch. filter. Where the receiver wakes up at regular intervals to look for an incoming packet.*
3. *Check for data packet every 1 second in LDC mode. 2-FSK, FREQDEV = 1.2 kHz DEV and 8 kHz ch. filter, DR=1.2 kbps, internal RC oscillator used as sleep timer. Sniff timer enabled.*
4. *Check for data packet every 1 second in LDC mode. 2-FSK, FREQDEV = 20 kHz, DR=38.4 kbps and 100 kHz ch. filter, internal 34.6 kHz RC oscillator used as sleep timer. Sniff timer enabled.*

**Table 8. Power consumption in transmission fc= 915 MHz**

| Parameter | Test conditions | Min. | Typ. | Max. | Unit |
|---|---|---|---|---|---|
| Supply current | TX CW @ 14 dBm | | 22 | | mA |
| | TX CW @ 10 dBm(1) | | 12.5 | | |
| | TX CW @ 16 dBm in Boost (2) | | 32 | | |

1. *SMPS output voltage 1.2 V, LDOs disable.*
2. *SMPS output voltage 1.8 V.*

**Table 9. Power consumption in transmission fc= 840-868 MHz**

| Parameter | Test conditions | Min. | Typ. | Max. | Unit |
|---|---|---|---|---|---|
| Supply current | TX CW @ 14 dBm | | 20 | | mA |
| | TX CW @ 10 dBm(1) | | 11.5 | | |
| | TX CW @ 16 dBm in Boost (2) | | 29 | | |

1. *SMPS output voltage 1.2 V, LDOs disable.*
2. *SMPS output voltage 1.8 V.*

**Table 10. Power consumption in transmission fc= 434 MHz**

| Parameter | Test conditions | Min. | Typ. | Max. | Unit |
|---|---|---|---|---|---|
| Supply current | TX CW @ 14 dBm(1) | | 21 | | mA |

| Parameter | Test conditions | Min. | Typ. | Max. | Unit |
|---|---|---|---|---|---|
| Supply current | TX CW @ 10 dBm(2) | | 11.5 | | mA |

1. *SMPS output voltage 1.6 V.*

## 4.5 General characterization

**Table 12. General characteristics**

| Parameter | | Typ. | Unit |
|---|---|---|---|
| Frequency range | | 413 - 479 | MHz |
| | | 452-527 | |
| | | 826 - 958 | |
| | | 904-1055 | |
| Data rate DR | 2-(G)FSK | 0.1 - 250 | kbps |
| | 4-(G)FSK | 0.2 - 500 | |
| | OOK/ASK | 0.1 -125 | |
| Data rate accuracy | | ±100 | ppm |
| Frequency deviation FDEV | | 0.15 - 500 | kHz |

If "Manchester" or "3-out-of-6" or FEC coding options are enabled the actual bit rate is affected as follows:

**Table 13. Data rate with different coding options**

| Coding option | 2GFSK[kbps] | 4GFSK[kbps] |
|---|---|---|
| NRZ | 250 | 500 |
| FEC | 125 | 250 |
| Manchester | 125 | Not supported |
| 3-out-of-6 | 166.6 | Not supported |

## 4.6 Frequency synthesizer

**Table 14. Frequency synthesizer parameters**

| Parameter | Test conditions | 50 MHz | Unit |
|---|---|---|---|
| Frequency step size | Out-loop divider ratio = 4 | 23.8 | Hz |
| RF carrier phase noise 433 MHz | 10 kHz | -109 | dBc/Hz |
| | 100 kHz | -110 | |
| | 1 MHz | -124 | |
| | 10 MHz | -141 | |
| RF carrier phase noise 510 MHz | 10 kHz | -108 | |
| | 100 kHz | -109 | |
| | 1 MHz | -124 | |
| | 10 MHz | -140 | |
| RF carrier phase noise 868 MHz | 10 kHz | -102 | |
| | 100 kHz | -103 | |
| | 1 MHz | -117 | |
| | 10 MHz | -138 | |
| RF carrier phase noise 915 MHz | 10 kHz | -102 | |
| | 100 kHz | -102 | |
| | 1 MHz | -117 | |
| | 10 MHz | -138 | |

## 4.7 Crystal oscillator

Characteristics measured over recommended operating conditions unless otherwise specified. All typical values are referred to 25 °C temperature, $V_{BAT}$ = 3.0 V.

The device supports crystals in the range [24-26] MHz and [48-52] MHz.

If the crystal is in the [24–26] MHz range, both the analog and the digital parts must work at this frequency. Otherwise, if a crystal in the [48-52] MHz range is used, the analog part must work at this frequency and the digital part at this frequency divided by 2. From now on in this document the XTAL oscillator will be indicated with $f_{XO}$ and the digital clock with $f_{dig}$

The divider for the digital part can be set by the PD_CLKDIV bit of the XO_RCO_CONFIG1 in the following way:

- if a [48 – 52] MHz crystal is used, this bit must be 0 (digital divider enabled):

$$f_{dig} = \frac{f_{xo}}{2} \quad (1)$$

- if a [24 – 26] MHz crystal is used, this bit must be 1 (digital divider disabled):

$$f_{dig} = f_{xo} \quad (2)$$

The safest procedure to disable the divider without any risk of glitches in the digital clock is to switch into STANDBY mode, hence, disable the divider through register setting, and then come back to the READY state.

In order to avoid potential RF performance degradations, the crystal frequency should be chosen to satisfy the following equation:

$$\left| nF_{CH} - \mathrm{ROUND}\left(n\frac{F_{CH}}{f_{XO}}\right) f_{XO} \right| \geq 1\mathrm{MHz} \quad (3)$$

where n is an integer in the set [1-7, B] (B is the synthesizer's divider ratio).

**Table 15. Crystal oscillator characteristics**

| Parameter | Test conditions | Min. | Typ. | Max. | Unit |
|---|---|---|---|---|---|
| Crystal frequency | | 24 | | 26 | MHz |
| | | 48 | | 52 | |
| Frequency tolerance (1) | | | ± 40 | | ppm |
| Minimum requirement on external reference phase noise mask $f_{XO} = 26$ MHz, to avoid degradation on synthesizer phase/noise | 10 kHz | | | -135 | dBc/Hz |
| | 100 kHz | | | -140 | |
| | 1 MHz | | | -140 | |
| | 10 MHz | | | -140 | |
| Programmable trans-conductance of the oscillator at start-up | | 13 | | 43 | mS |
| Start-up time (2) | VBAT=1.8 V, $f_{XO} = 26$ MHz | | 100 | | µs |

1. *Including initial tolerance, crystal loading, aging, and temperature dependence. The acceptable crystal tolerance depends on RF frequency and channel spacing/bandwidth.*
2. *Start-up times are crystal dependent. The crystal oscillator trans-conductance can be tuned to compensate the variation of crystal oscillator series resistance.*

**Table 16. Ultra-low power RC oscillator**

| Parameter | Test conditions | Typ. | Unit |
|---|---|---|---|
| Calibrated frequency | Calibrated RC oscillator frequency is derived from crystal oscillator frequency. | 33.3 (1) | kHz |
| Frequency accuracy after calibration | | ±1 | % |

1. *Depending on the crystal frequency, the reported value is referring to 50 MHz.*

## 4.8 RF receiver

Characteristics measured over recommended operating conditions unless otherwise specified. All typical values are referred to 25 °C temperature, $V_{BAT}$ = 3.3 V, no frequency offset in the RX signal. The whole performance is referred to the STEVAL-FKI433V2, STEVAL-FKI512V1 or STEVAL-FKI868V2 with a 50 Ohm antenna connector.

**Table 17. RF receiver characteristics**

| Parameter | Test conditions | | HPM/LPMSMPS on typ. | Unit |
|---|---|---|---|---|
| Receiver channel bandwidth CHF | | | 1-800 | kHz |
| RX input return loss | Max. RX gain, tied (RX + TX) matching networks | 433 MHz | -15 | dB |
| | | 868 MHz | -15 | |
| Saturation 1% BER | 2-FSK 1.2 kHz FDEV, DR = 1.2 kbps, CHF = 4 kHz | 433 MHz | 10 | dBm |
| | | 868 MHz | 10 | |
| Input third order intercept point | Interferers are continuous wave @ 6 MHz and 12 MHz offset from carrier | 433 MHz | -25 | |
| | | 868 MHz | -25 | |
| RX noise figure | Max. RX gain, tied (RX + TX) matching networks | 433 MHz | 8 | dB |
| | | 868 MHz | 8 | |
| Differential input impedance at LNA | Max. RX gain<br>R // C | 433 MHz | 200 // 1.5 | Ω//pF |
| | | 868 MHz | 200 // 1.5 | |

### 4.8.1 Blocking and selectivity at 433 MHz

**Table 18. Blocking and selectivity at 433 MHz**

| Parameter | Test condition | HPM SMPS on (typ.) | LPM SMPS ON typ. | Unit |
|---|---|---|---|---|
| Selectivity and blocking 1%<br>BER @ 2-GFSK BT=0.5 1.2 kHz FDEV, DR = 1.2 kbps, CHF = 4 kHz | +12.5 kHz (adjacent channel) | 64 | 56 | dB |
| | -12.5 kHz (adjacent channel) | 64 | 56 | |
| | +25 kHz (alternate channel) | 65 | 59 | |
| | -25 kHz (alternate channel) | 65 | 59 | |
| | Image rejection | 60 | 63 | |
| | ±2 MHz | 81 | 81 | |
| | ±10 MHz | 82 | 85 | |
| Selectivity and blocking 1%<br>BER @ 2-GFSK BT=0.5 20 kHz FDEV, DR = 38.4 kbps, CHF = 100 kHz | +100 kHz (adjacent channel) | 50 | 37 | dB |
| | -100 kHz (adjacent channel) | 50 | 37 | |
| | +200 kHz (alternate channel) | 51 | 45 | |
| | -200 kHz (alternate channel) | 51 | 45 | |
| | Image rejection | 56 | 58 | |
| | ±2 MHz | 67 | 67 | |
| | ±10 MHz | 69 | 72 | |

### 4.8.2 Sensitivity at 433 MHz

**Table 19. Sensitivity at 433 MHz**

| Parameter | Test conditions | HPM/LPM SMPS on (typ.) | Unit |
|---|---|---|---|
| Sensitivity<br>1% BER @ 2-GFSK BT = 0.5 | DR = 0.3 kbps, FDEV = 0.25 kHz, CHF = 1 kHz | -128 | dBm |
| | DR = 1.2 kbps, FDEV = 1.2 kHz, CHF = 4 kHz | -122 | |
| | DR = 38.4 kbps, FDEV = 20 kHz, CHF = 100 kHz | -109 | |
| | DR = 250 kbps, FDEV = 125 kHz, CHF = 780 kHz | -101 | |
| Sensitivity<br>1% BER @ 4-GFSK BT = 0.5 | DR = 4.8 ksps, DEV = 2.4 kHz, CHF = 10 kHz | -114 | dBm |
| | DR = 9.6 ksps, DEV = 4.8 kHz, CHF = 20 kHz | -111 | |
| | DR = 19.2 ksps, DEV = 9.6 kHz, CHF = 40 kHz | -108 | |
| Sensitivity<br>1% BER @ OOK | DR = 0.3 kbps, CHF = 1 kHz | -120 | dBm |
| | DR = 1.2 kbps, CHF = 4 kHz | -118 | |
| | DR = 38.4 kbps, CHF = 100 kHz | -104 | |
| | DR = 125 kbps, CHF = 250 kHz | -100 | |

### 4.8.3 Blocking and selectivity @ 510 MHz

**Table 20. Blocking and selectivity @ 510 MHz**

| Parameter | Test conditions | HPM SMPS on (typ.) | LPM SMPS on (typ.) | Unit |
|---|---|---|---|---|
| Selectivity and blocking 1% BER @ 2-GFSK BT = 0.5, 1.2 kHz FDEV, DR = 1.2 kbps, CHF = 4 kHz | +12.5 kHz (adjacent channel) | 64 | 56 | dB |
| | -12.5 kHz (adjacent channel) | 65 | 56 | |
| | +25 kHz (alternate channel) | 64 | 59 | |
| | -25 kHz (alternate channel) | 65 | 59 | |
| | Image rejection | 60 | 63 | |
| | ± 2 MHz | 81 | 81 | |
| | ± 10 MHz | 82 | 85 | |
| Selectivity and blocking 1% BER @ 2-GFSK BT = 0.5, 20 kHz FDEV, DR = 38.4 kbps, CHF = 100 kHz | +100 kHz (adjacent channel) | 50 | 37 | dB |
| | -100 kHz (adjacent channel) | 50 | 37 | |
| | +200 kHz (alternate channel) | 51 | 45 | |
| | -200 kHz (alternate channel) | 51 | 45 | |
| | Image rejection | 56 | 58 | |
| | ± 2 MHz | 67 | 67 | |
| | ± 10 MHz | 69 | 72 | |

### 4.8.4 Sensitivity at 510 MHz

**Table 21. Sensitivity at 510 MHz**

| Parameter | Test conditions | HPM/LPM SMPS on (typ.) | Unit |
|---|---|---|---|
| Sensitivity 1% BER @ 2-GFSK BT = 0.5 | DR = 0.3 kbps, FDEV = 0.25 kHz, CHF = 1 kHz | -128 | dBm |
| | DR = 1.2 kbps, FDEV = 1.2 kHz, CHF = 4 kHz | -122 | |
| | DR = 38.4 kbps, FDEV = 20 kHz, CHF = 100 kHz | -109 | |
| | DR = 250 kbps, FDEV = 125 kHz, CHF = 780 kHz | -101 | |
| Sensitivity 1% BER @ 4-GFSK BT = 0.5 | DR = 4.8 kbps, DEV = 2.4 kHz, CHF = 10 kHz | -114 | dBm |
| | DR = 9.6 kbps, DEV = 4.8 kHz, CHF = 20 kHz | -111 | |
| | DR = 19.2 kbps, DEV = 9.6 kHz, CHF = 40 kHz | -108 | |
| Sensitivity 1% BER @ OOK | DR = 0.3 kbps, CHF = 1 kHz | -120 | dBm |
| | DR = 1.2 kbps, CHF = 4 kHz | -118 | |
| | DR = 38.4 kbps, CHF = 100 kHz | -104 | |
| | DR = 125 kbps, CHF = 250 kHz | -100 | |

### 4.8.5 Blocking and selectivity at 868 MHz

**Table 22. Blocking and selectivity @ 868 MHz**

| Parameter | Test conditions | HPM SMPS on (typ.) | LPM SMPS on (typ.) | Unit |
|---|---|---|---|---|
| Selectivity and blocking 1% BER @ 2-GFSK BT = 0.5, 1.2 kHz FDEV, DR = 1.2 kbps, CHF = 4 kHz | +12.5 kHz (adjacent channel) | 58 | 50 | dB |
| | -12.5 kHz (adjacent channel) | 58 | 50 | |
| | +25 kHz (alternate channel) | 59 | 51 | |
| | -25 kHz (alternate channel) | 59 | 51 | |
| | Image rejection | 58 | 60 | |
| | ± 2 MHz | 81 | 81 | |
| | ± 10 MHz | 82 | 86 | |
| Selectivity and blocking 1% BER @ 2-GFSK BT = 0.5, 20 kHz FDEV, DR = 38.4 kbps, CHF = 100 kHz | +100 kHz (adjacent channel) | 44 | 33 | dB |
| | -100 kHz (adjacent channel) | 44 | 33 | |
| | +200 kHz (alternate channel) | 45 | 39 | |
| | -200 kHz (alternate channel) | 45 | 39 | |
| | Image rejection | 50 | 55 | |
| | ± 2 MHz | 67 | 70 | |
| | ± 10 MHz | 69 | 73 | |

### 4.8.6 Sensitivity at 868 MHz

**Table 23. Sensitivity at 868 MHz**

| Parameter | Test conditions | HPM/LPM/SMPS on typ. | Unit |
|---|---|---|---|
| Sensitivity 1% BER @ 2-GFSK BT = 0.5 | DR = 0.3 kbps, FDEV = 0.25 kHz, CHF = 1 kHz | -128 | dBm |
| | DR = 1.2 kbps, FDEV = 1.2 kHz, CHF = 4 kHz | -122 | |
| | DR = 38.4 kbps, FDEV = 20 kHz, CHF = 100 kHz | -109 | |
| | DR = 250 kbps, FDEV = 125 kHz, CHF = 780 kHz | -101 | |
| Sensitivity 1% BER @ 4-GFSK BT = 0.5 | DR = 4.8 ksps, DEV = 2.4 kHz, CHF = 10 kHz | -114 | dBm |
| | DR = 9.6 ksps, DEV = 4.8 kHz, CHF = 20 kHz | -111 | |
| | DR = 19.2 ksps, DEV = 9.6 kHz, CHF = 40 kHz | -108 | |
| Sensitivity 1% BER @ OOK | DR = 0.3 kbps, CHF = 1 kHz | -120 | dBm |
| | DR = 1.2 kbps, CHF = 4 kHz | -118 | |
| | DR = 38.4 kbps, CHF = 100 kHz | -104 | |
| | DR = 125 kbps, CHF = 250 kHz | -100 | |

### 4.8.7 Blocking and selectivity at 915 MHz

**Table 24. Blocking and selectivity at 915 MHz**

| Parameter | Test condition | HPM/ SMPS on typ. | LPM/ SMPS on typ. | Unit |
|---|---|---|---|---|
| Selectivity and blocking 1%<br>BER @ 2-GFSK BT=0.5 1.2 kHz FDEV, DR = 1.2 kbps, CHF = 4 kHz | +12.5 kHz (adjacent channel) | 58 | 50 | dB |

## 4.10 Digital interface specification

**Table 33. Digital SPI input, output and GPIO specification**

| Parameter | Test conditions | Min. | Typ. | Max. | Unit |
|---|---|---|---|---|---|
| SPI clock frequency | | | 8 | 10 | MHz |
| Port I/O capacitance | | | 1.4 | | pF |
| Rise time | From 0.1*VDD to 0.9*VDD, CL=20 pF (low output current programming) | | 6.0 | | ns |
| | From 0.1*VDD to 0.9*VDD, CL=20 pF (high output current programming) | | 2.5 | | |
| Fall time | From 0.1*VDD to 0.9*VDD, CL=20 pF (low output current programming) | | 7.0 | | ns |
| | From 0.1*VDD to 0.9*VDD, CL=20 pF (high output current programming) | | 2.5 | | |
| Logic high level input voltage | | VDD/2 +0.3 | | | V |
| Logic low level input voltage | | | | VDD/8 +0.3 | V |
| High level output voltage | IOH = -2.4 mA (-4.2 mA into high output current mode). | (5/8)* VDD+ 0.1 | | | V |
| Low level output voltage | IOL = +2.0 mA (+4.0 mA into high output current mode). | | | 0.5 | V |
| CSn low to positive edge on SCLK in low power mode state | | | 40 | | µs |
| CSn low to positive edge on SCLK in ready state | | 30 | | | ns |

## 4.11 Battery indicator

Characteristics measured over recommended operating conditions unless otherwise specified. All typical values are referred to 25 °C temperature, $V_{BAT}$ = 3.0 V.

**Table 34. Battery indicator and low battery detector**

| Parameter | Test conditions | Min. | Typ. | Max. | Unit |
|---|---|---|---|---|---|
| Battery level thresholds #1 | | | 2.1 | | V |
| Battery level thresholds #2 | | | 2.3 | | |
| Battery level thresholds #3 | | | 2.5 | | |
| Battery level thresholds #4 | | | 2.7 | | |
| Brownout threshold | Measured in slow battery variation (static) conditions (inaccurate mode) | | 1.5 | | |

| Parameter | Test conditions | Min. | Typ. | Max. | Unit |
|---|---|---|---|---|---|
| Brownout threshold | Measured in slow battery variation (static) conditions (accurate mode) | | 1.7 | | V |
| Brownout threshold hysteresis | | | 70 | | mV |

*Note: For battery-powered equipment, the TX does not transmit at a wrong frequency under low battery voltage conditions. It remains on either channel or stops transmitting. The latter can of course be realized by using a lock detect and/or by switching off the PA under control of the battery monitor. For testing reasons this control is enabled/disabled by SPI.*

# 5 Block description

## 5.1 Power management

The S2-LP integrates a high efficiency step-down converter cascaded with LDOs meant to supply both analog and digital parts. However, an LDO directly fed by the external battery provides a controlled voltage to the data interface block.

S2-LP's power management (PM) strategy, besides the basic functionality of providing different blocks with proper supplies, faces two main constraints: the first one is to implement such a power distribution with maximum efficiency, and the second one is to guarantee the isolation among critical blocks.

The efficiency target is obtained by using a switch mode power supply (SMPS) which converts the battery voltage (1.8 V - 3.6 V) to a lower voltage (settable from 1.2 V to 1.8 V) with efficiency higher than 90%.

The SMPS output voltage can be controlled by the SET_SMPS_LVL field in the PM_CONF0 register. The relation between the SET_SMPS_LVL and the $V_{OUT}$ of the SMPS is given by the following table:

**Table 35. SMPS output voltage**

| SET_SMPS_LVL | SMPS output voltage |
|---|---|
| 001b | 1.2 V |
| 010b | 1.3 V |
| 011b | 1.4 V |
| 100b | 1.5 V |
| 101b | 1.6 V |
| 110b | 1.7 V |
| 111b | 1.8 V |

The SMPS output voltage can be controlled in TX only or for both RX and TX according to the SMPS_LVL_MODE bit of the PM_CONF1 register.

- 1: SMPS output level will depend upon the value in PM_CONFIG register just in TX state, while in RX state it will be fixed to 1.4 V.
- 0: SMPS output level will depend upon the value written in the PM_CONFIG0 register (SET_SMPS_LEVEL field) both in RX and TX state.

The SMPS switching frequency is settable by the 2 registers PM_CONF3 and PM_CONF2.

If the KRM_EN is 0, then the digital divider by 4 enabled. In this case SMPS' switching frequency is:

$$F_{sw} = \frac{f_{dig}}{4} \quad (4)$$

If the KRM_EN is 1, the SMPS' switching frequency can be set by the KRM word according to the formula:

$$F_{sw} = K_{rm}\frac{f_{dig}}{2^{15}} \quad (5)$$

As $f_{dig}$ is the digital domain frequency ($f_{XO}$ if it is 24, 25 or 26 MHz) and ($\frac{f_{XO}}{2}$ if $f_{XO}$ is 48, 50 or 52 MHz).

All the RX measurements reported in this datasheet have been taken with a SMPS frequency set to 1.56 MHz.

From the formula reported with fdig = 25 MHz, PM_CONF3 = 0x87, PM_CONF2 = 0xFC, the $F_{sw}$ is 1.56. It is possible to have a little improvement of the sensitivity reducing the SMPS switching frequency but having as drawback a higher current consumption.

The isolation target is reached by using, for each critical block, a dedicated linear low-dropout regulator (LDO), which provides typically 1.2 V output voltage, either from battery level or from SMPS level, depending from the operating mode.

If the output of the LDO is 1.2 V the minimum value of the SMPS, $V_{out}$ must be at least 100 mV higher than the $V_{out}$ of the LDO. This means that in HPM (SMPS+LDO) the minimum value of the SMPS_VOUT must be 1.3 V.

The S2-LP PM can be configured by SPI (BYPASS_LDO field in PM_CONFIG [1] register) in two main modes:

1. High performance mode (HPM)
2. Low power mode (LPM)

In HPM all available LDOs supplied from SMPS are used, to get the best possible isolation and minimum low-frequency noise level and SMPS ripple. SMPS must be set to 1.4 V at least.

In LPM the LDOs connected to the SMPS are by-passed and SMPS must be configured to provide 1.2 V output level to increase the regulation efficiency but with reduced isolation and higher low-frequency noise and SMPS ripple.

The load inductor of the SMPS has to have the following characteristics:

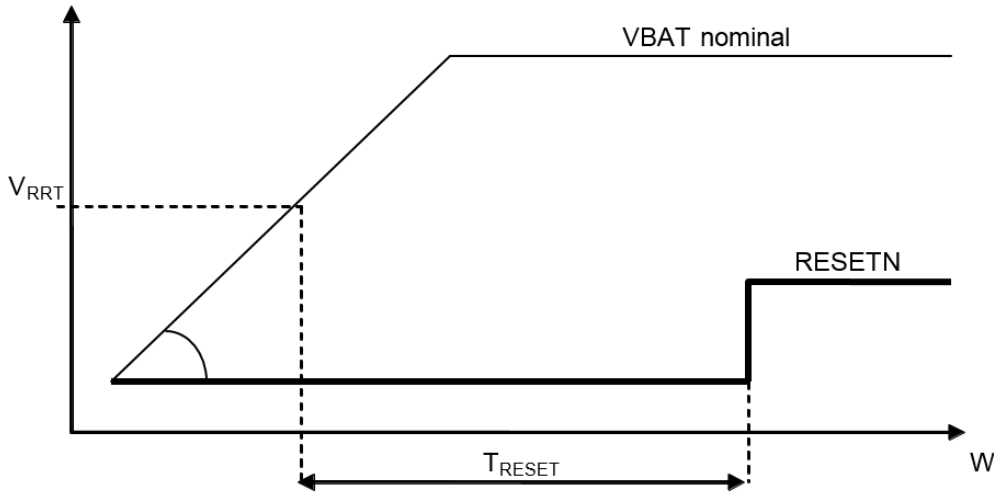
- A typical 10 µH nominal value +/-10%
- A rated current of 100 mA minimum
- A DC resistance as low as possible (to guarantee maximum efficiency of the SMPS block), around 1 Ohm is a typically good value, but the lower the better

## 5.2 Power-On-Reset

The Power-On-Reset (POR) circuit generates a reset pulse upon power-up which is used to initialize the entire digital logic. Power-on-reset senses $V_{BAT}$ voltage.

The S2-LP provides an automatic POR circuit, which generates an internal RESETN (active low) level for a time $T_{RESET}$, after the $V_{BAT}$ reaches the reset release voltage threshold $V_{RRT}$, as shown in Figure 6. Power-On-Reset timing and limits. The same reset pulse is generated after a step-down on the input pin SDN (VDD>$V_{RRT}$). This signal is available on the GPIO0 pin.

**Figure 6. Power-On-Reset timing and limits**



The parameters VRRT and TRESET are fixed by design in order to guarantee a reliable reset procedure of the state machine. In addition, all the registers are initialized to their default values.

A software command SRES is also available, it generates an internal but partial resetting of the S2-LP.

**Table 36. POR parameters**

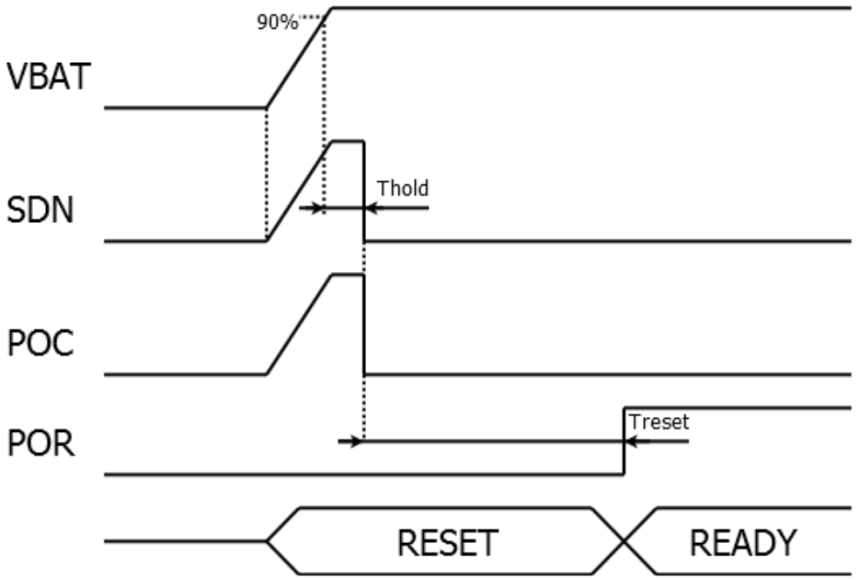
| Parameter | Comment | Min. | Typ. | Max. | Unit |
|---|---|---|---|---|---|
| Reset start-up threshold voltage | | | 0.5 | | V |
| Hold pulse width ($T_{hold}$, figure below) | For SDN to be effective | 1 | | | µs |
| Reset pulse width ($T_{reset}$, figure below) | | | 0.7 | 2 | ms |
| Power-on VDD slope | | | 2.0 | | V/ms |

The following picture shows how the S2-LP must be controlled, i.e. the SDN signal must be tied to VBAT pin in order to avoid two potential issues during the start-up phase:

1. A cross conduction can appear on the GPIO until an available command is present on it.
2. The ESD protection diode from the SDN pad can sink current from the external driver connected to the SDN.

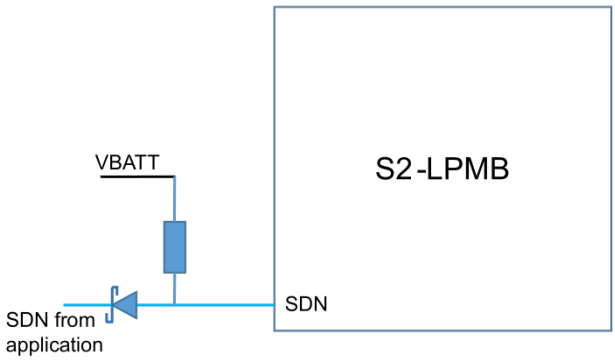
Also the SDN signal generates an internal signal (POC), which disables the digital I/Os when set to 1.

**Figure 7. Start-up phase**



Examples of possible connections

**Figure 8. Examples of possible connections for SDN pin**



## 5.3 RF synthesizer

A crystal connected to XIN and XOUT provides a clock signal to the frequency synthesizer. The allowed clock signal frequency is in the range [24-26] and [48-52] MHz.

As an alternative, an external clock signal feeds XIN for proper operation. In this option, XOUT can be left either floating or tied to ground.

Since the digital macro cannot be clocked at that double frequency (48, 50 or 52 MHz), a divided clock is used in this case (see Section 4.7 Crystal oscillator).

The integrated phase locked loop (PLL) is capable to synthesize a band of frequencies from 413 to 479 MHz, 452 to 527 MHz, 826 to 958 MHz or from 904 - 1055 MHz, providing the LO signal for the RX chain and the input signal for the PA in the TX chain.

Depending on the RF frequency and channel used, a very high accurate crystal or TCXO can be required.

The RF synthesizer implements fractional sigma delta architecture to allow fast settling and narrow channel spacing. It is fully integrated, and it uses a multi-band VCO to cover the whole frequency range. All internal calibrations are automatic.

According to the frequency synthesized the user must set the charge pump current according to the LO frequency variations, in order to have a constant loop bandwidth. The charge pump current is controlled by the PLL_CP_ISEL field (SYNT3 register) and the PLL_PFD_SPLIT_EN (SYNTH_CONFIG2). These fields should be set in the following way:

**Table 37. Charge pump words**

| VCO Freq (MHz) | fxo (MHz) | PLL_CP_ISEL | PLL_PFD_SPLIT_EN | ICP (µA) |
|---|---|---|---|---|
| 3760 | 50 | 010 | 0 | 120 |
| 3760 | 25 | 001 | 1 | 200 |
| 3460 | 50 | 011 | 0 | 140 |
| 3460 | 25 | 010 | 1 | 240 |

The S2-LP provides an automatic and very fast calibration procedure for the frequency synthesizer. If not disabled, it performs the calibration each time the synthesizer is required to lock to the programmed RF channel frequency (transaction from READY to LOCK/TX/RX or from RX to TX and vice versa). After completion, the S2-LP uses the calibration word and is stored in registers.

In order to get the synthesizer locked with the calibration procedure disabled, the correct calibration words must be previously stored in registers by user for TX and RX respectively. The advantage is reduce the LOCK setting time.

The transition time enables the S2-LP for frequency hopping operation due to its reduced response time and very quick programming synthesizer.

### 5.3.1 RF channel frequency settings

The channel center frequency can be programmed as follows:

**Center frequency setting**

$$f_C = f_{base} + \left(\frac{f_{XO}}{2^{15}} \cdot CHSPACE\right) \cdot CHNUM \quad (6)$$

The $f_{base}$ sets the main channel frequency; the value depends on the value of $f_{XO}$ (the frequency of the XTAL oscillator, typically 24-26 MHz or 48-52 MHz.

**Base frequency setting**

$$f_{base} = \frac{f_{XO}}{\frac{B}{2} \cdot D} \cdot \frac{SYNT}{2^{20}} \quad (7)$$

where:

SYNT is a programmable 28-bits integer (SYNT[3:0] registers).

B is the out-of-loop SYNTH divider (BS field of the SYNT3 register):

**PLL divider**

(8)

$$B = \begin{cases} 4\ for\ the\ high\ band & (826\ MHz\ to\ 1055\ MHz,\ BS = 0) \\ 8\ for\ the\ middle\ band & (413\ MHz\ to\ 527\ MHz,\ BS = 1) \end{cases}$$

D is the reference divider (REFDIV bit of XO_RCO_CONFIG0 register)

**Reference divider**

$$\boldsymbol{D} = \begin{cases} 1\ if\ REFDIV = 0\ (\boldsymbol{internal\ reference\ divider\ is\ disabled}) \\ 2\ if\ REFDIV = 1\ (\boldsymbol{internal\ reference\ divider\ is\ enabled}) \end{cases} \quad (9)$$

The resolution in the programmed value of the base frequency depends on the actual band selected.

**Table 38. Resolution frequency**

| fxo [MHz] | High band resolution [Hz] | Low band resolution [Hz] |
|---|---|---|
| 24 | 11.4 | 5.7 |
| 25 | 11.9 | 6.0 |
| 26 | 12.4 | 6.2 |
| 48 | 22.9 | 11.4 |
| 50 | 23.8 | 11.9 |
| 52 | 24.8 | 12.4 |

The $f_c$ is the frequency related to the channel specified. RF channels can be defined using the CHSPACE and CHNUM registers. In this way, it is possible to change faster the channel by changing just an 8-bits register, allowing the setting of 256 channels and frequency-hopping sequences. The actual channel spacing is from 793 Hz to 202342 Hz in 793 Hz steps for the 26 MHz configuration and from 1587 to 404685 Hz in 1587 Hz steps for the 52 MHz configuration.

**Table 39. Channel spacing resolution**

| fxo [MHz] | Channel spacing resolution [Hz] |
|---|---|
| 24 | 732.42 |
| 25 | 762.94 |
| 26 | 793.45 |
| 48 | 1464.84 |
| 50 | 1525.88 |
| 52 | 1586.91 |

## 5.4 Digital modulator

The S2-LP supports frequency modulation: 2-FSK, 4-FSK, 2-GFSK, 4-GFSK as well amplitude modulation OOK and ASK. Using register, the user can also program an unmodulated carrier for lab test and measurement.
A special mode, direct polar modulation, allows building specific modulation scheme controlling directly the amplitude and the frequency of the carrier synthesized. The register MOD_TYPE is used to select one of the following modulation scheme.

**Table 40. Modulation scheme**

| MOD_TYPE | Modulation scheme |
|---|---|
| 0000b | 2-FSK |
| 0001b | 4-FSK |
| 0010b | 2-GFSK |
| 0011b | 4-GFSK |

| MOD_TYPE | Modulation scheme |
|---|---|
| 0101b | ASK/OOK |
| 0110b | Direct polar (TX only) |
| 0111b | CW |

### 5.4.1 Frequency modulation

For frequency modulation 2-(G)FSK and 4-(G)FSK the frequency deviation can be tuned in wide range that depends on $f_{xo}$ (XTAL frequency) according the following formula:

**Frequency deviation**

$$f_{dev} = \begin{cases} \frac{f_{XO}}{2^{19}} \cdot \frac{round\left(D \cdot FDEV\_M \cdot {}^{B}/_{8}\right)}{D \cdot B} & if\ FDEV\_E = 0 \\ \frac{f_{XO}}{2^{19}} \cdot \frac{round\left(D \cdot \left(256 + FDEV\_M\right) \cdot 2^{(FDEV\_E - 1)} \cdot {}^{B}/_{8}\right)}{D \cdot B} & if\ FDEV\_E > 0 \end{cases} \quad (10)$$

Where $f_{xo}$ is the XTAL oscillation frequency, D is the reference divider and B is the band selector.

The frequency deviation programmed corresponds to the deviation of the outer constellation symbols. The deviation of the inner symbols is 1/3 of such programmed values, as reported in the table below, where 4 options are available.

Furthermore, since the payload is normally arranged in bytes, the arrangement can change the mapping for both 2-(G)FSK and 4-(G)FSK modulations, by using the CONST_MAP (register MOD1), in the following way:

**Table 41. Constellation mapping 2-(G)FSK**

| Format | Symbol | CONST_MAP coding | | | |
|---|---|---|---|---|---|
| | | 0 | 1 | 2 | 3 |
| 2-(G)FSK | 0 | -FDEV | NA | +FDEV | NA |
| | 1 | +FDEV | NA | -FDEV | NA |

**Table 42. Constellation mapping 4-(G)FSK**

| Format | Symbol | CONST_MAP coding | | | |
|---|---|---|---|---|---|
| | | 0 | 1 | 2 | 3 |
| 4-(G)FSK | 00 | -FDEV/3 | -FDEV | +FDEV/3 | +FDEV |
| | 01 | -FDEV | -FDEV/3 | +FDEV | +FDEV/3 |
| | 10 | +FDEV/3 | +FDEV | -FDEV/3 | -FDEV |
| | 11 | +FDEV | +FDEV/3 | -FDEV | -FDEV/3 |

Furthermore, in the 4-(G)FSK it is also possible to swap the symbols using the 4FSK_SYM_SWAP field (register PCKTCTRL3) as follows:

(11)

$$\text{When 4FSK\_SYM\_SWAP} = 0: \begin{cases} S0 = < b7b6 > \\ S1 = < b5b4 > \\ S2 = < b3b2 > \\ S3 = < b1b0 > \end{cases}$$

$$\text{When 4FSK\_SYM\_SWAP} = 1 \begin{cases} S0 = < b6b7 > \\ S1 = < b4b5 > \\ S2 = < b2b3 > \\ S3 = < b0b1 > \end{cases}$$

#### 5.4.1.1 *Gaussian shaping*

In 2-GFSK or 4-GFSK mode, the Gaussian filter BT product can be set by using the register BT_SEL to 1 or 0.5.

The Gaussian filtering is implemented by poly-phase filtering with eight taps per symbol time. In order to further smooth the filter shape and improve spectral shaping, the output of the filter can be linearly interpolated by setting the register MOD_INTERP_EN.

A mathematical interpolation factor is applied at each sample of the Gaussian filter output. This factor is 64 for data rates corresponding to DATA_RATE_E < 5, it is automatically scaled as $\frac{64}{2^{DATA\_RATE\_E-5}}$ for 5 ≤ DATA_RATE_E < 11 and it is automatically disabled for DATA_RATE_E = 11.

*Note: The actual interpolation factor achieved may be limited by the minimal frequency resolution of the frequency synthesizer.*

#### 5.4.1.2 *ISI cancellation 4-(G)FSK*

Since the 4-(G)FSK modulation format strongly suffers from the effect of inter symbol interference, an ISI cancellation equalizer has been introduced in the demodulator. An equalizer can be enabled, by using the EQU_CTRL register, with two modes: single pass equalization and dual pass equalization. The best performance is normally achieved using the dual pass equalizer.

### 5.4.2 Amplitude modulation

Amplitude modulation OOK and ASK are both supported by the S2-LP. The ASK selection depends on power ramping enable.

When OOK is selected, a bit '1' is transmitted with a programmed power, set by register PA_POWER[PA_LEVEL_MAX_INDEX], and a bit '0' is transmitted without output power (PA off) and specified by the register PA_POWER[0].

In case PA_POWER[0] = 0 then the modulation will be OOK, otherwise when PA_POWER[0] is not set to zero the modulation will be ASK. The 0/1 mapping can be reversed by setting the CONST_MAP register to any value other than zero.

When ASK is selected, a bit '1' is transmitted with a power ramp increasing from the minimum value specified by register PA_POWER[0] to specified PA maximum level in register PA_POWER[PA_LEVEL_MAX_INDEX], vice versa for a bit '0'. The duration of each power step is a multiple of 1/8 of the symbol time, configurable with the register PA_RAMP_STEP_WIDTH. If more '1's are transmitted consecutively, the PA power maintains the output power at the programmed value. If more '0's are transmitted consecutively, the PA power remains at minimum power for all '0's following the first one.

In order to improve the spectral emission mask is ASK a digital interpolation optional features have been implemented. When this feature is enabled, thought the register PA_INTERP_EN, the modulator linearly interpolates the power values specified in the PA_POWER registers before being applied to the PA.

The interpolation factor of each ramp step is 64 time the data rate corresponding to DATA_RATE_E < 5 it is automatically scaled as $64/2^{(DATA\_RATE\_E-5)}$ for 5 ≤ DATA_RATE_E < 11 and it is automatically disabled for DATA_RATE_E=11.

Note that the number of clock cycles between successive PA ticks, for DATA_RATE_E≥5, is always between 8 and 4 (8 for DATA_RATE_M=0; 4 for DATA_RATE_M=65535).

OOK/ASK demodulation is controlled by the OOK_PEAK_DECAY parameter ( recommended value is 3) in the RSSI_FLT register.

#### 5.4.2.1 *OOK smoothing*

The OOK can be smoothed using a FIR filter added in the data path. This feature is activated by setting the FIR_EN bit at 1 inside register PA_CONFIG1.

The FIR filter is not fully customizable but it can be set in 3 different configurations that change the spectrum shape (and thus the bandwidth):

- **filter**: it is the proper FIR filtering function of the stream of bits 8 times oversampled;
- **ramp**: the FIR filter is optimized to perform a ramping between PA_POWER_MAX and PA_POWER_0 (for OOK should be set to 0).
- **switch**: logic 1s and 0s are associated with a single value of power and no transition between the 2 is envisaged.

When the FIR_EN bit is 1, the DIG_SMOOTH_EN (PA_POWER_0 register) must be set to 1.

Finally, a 2nd order Bessel analog filter can be used to smooth the output signal. The bandwidth of this filter should be set according to the data rate used by setting the PA_FC field of the register PA_CONFIG0 according to the following table:

Table 43. **PA Bessel filter words**

| PA_FC bits | Cut-off frequency (kHz) | Max. data rate (kbit/s) |
|---|---|---|
| 00 | 12.5 | 16 |
| 01 | 25 | 32 |
| 10 | 50 | 62.5 |
| 11 | 100 | 125 |

*Note: The FIR ramping modes are used in a mutually exclusive way with the digital ramping. When the digital ramping is used, the FIR ramping should be disabled. Vice versa, if the FIR ramping is used, the digital one is not used.*

### 5.4.3 Direct polar mode

The S2-LP allows the user to drive the SYNTH and the PA at a very low level. The byte couples written in the TX_FIFO are sampled with a rate related to the DATARATE chip setting (sampling rate = 8*DATARATE).

The first byte of the couple drives the frequency synthesizer to obtain an instantaneous output frequency deviation given by the formula below:

**Frequency deviation in polar mode**

$$fdev = fdev\_programmed * \frac{fdev\_fifo\_sample}{128} \quad (12)$$

Where $fdev\_programmed$ is the frequency deviation programmed in the chip by the registers MOD[1:0] (see Section 5.4.1 Frequency modulation), $fdev\_fifo\_sample$ is the first byte of the bytes couple sampled from the TX_FIFO.

The $fdev\_fifo\_sample$ is interpreted as a 2-complement 8-bit number, thus it can be either a positive or a negative value.

The instantaneous frequency is given by the formula:

**Instantaneous frequency in polar mode**

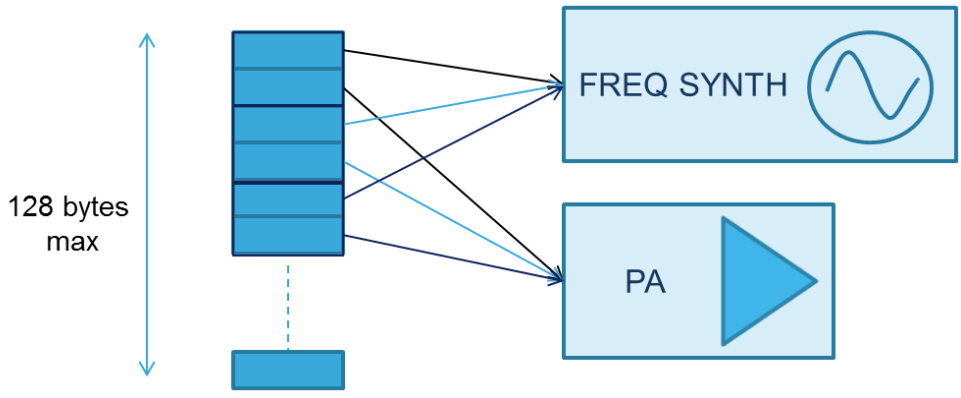
$$f = fc\_programmed + fdev \quad (13)$$

The second byte of the TX_FIFO couple drives the PA giving an instantaneous output power.

The output power will be generated according to this value following the same code as the PA_POWER registers (see Section 5.6.1 PA configuration).

Figure 9. Direct polar mode shows how the byte couples are sampled from the TX FIFO and sent to the SYNTH and PA blocks.

Figure 9. **Direct polar mode**



As for the normal TX operations, the TX_FIFO samples are consumed and a management of the TX_FIFO_THRESHOLD is needed to perform transmissions longer than 128 samples.

The transmission is never automatically stopped and a specific command SABORT should be given to terminate it.

This function is suitable to implement differential binary phase shift keying modulation (DBPSK) such as the data modulation used by the SigFox protocol.

### 5.4.4 Test modes

#### 5.4.4.1 *Continuous wave*

The device can be programmed to generate a continuous wave carrier without any modulation. In this way, the carrier will be continuously transmitted until a SABORT command is sent to the device.

To set the continuous wave the MOD_TYPE field (of the MOD2 register) must be set to 0x77.

#### 5.4.4.2 *PN9*

It is possible to set a pseudo random binary sequence 9 (PN9) as data source for the modulator. In this way, these data are continuously modulated until a SABORT command is sent to the device.

The TXSOURCE field (of the PCKTCTRL1 register) must be set to 0x03.

### 5.4.5 Data rate

The data rate programmable is from 0.1 kbps to 500 kbps (see Table 12. General characteristics for further details).

The data rate formula that relates the value of the DATARATE_M and DATARATE_E registers to the data rate in symbol per second is the following:

**Data rate formula**

$$DataRate = \begin{cases} f_{dig} \cdot \dfrac{DATARATE\_M}{2^{32}} & if\ DATARATE\_E = 0 \\ f_{dig} \cdot \dfrac{\left(2^{16} + DATARATE\_M\right) \cdot 2^{DATARATE\_E}}{2^{33}} & if\ DATARATE\_E > 0 \\ \dfrac{f_{dig}}{8 \cdot DATARATE\_M} & if\ DATARATE\_E = 15 \end{cases} \quad (14)$$

where $f_{dig}$ is the digital clock frequency.

In the cases where DATARATE_E<15, the actual modulator timing is generated by a fractional clock divider hence is affected by a certain amount of jitter. In order to have a jitter free data rate generation a specific mode the last equation must be used, DATARATE_E = 15 (for transmission only).

## 5.5 Receiver

The S2-LP contains a low-power low-IF receiver able to amplify the input signal and provide it to the ADC with a proper signal to noise ratio. The RF antenna signal is converted to a differential one by an external balun, which performs an impedance transformation also. The receiver gain can be programmed to accommodate the ADC input signal within its dynamic range. After the down-conversion at IF, a first order filter is implemented to attenuate the out-of-band blockers.

### 5.5.1 Automatic frequency compensation

The automatic frequency compensation (AFC for short) algorithm allows compensating, within certain limits, a relative frequency error between the transmitting device and the receiving one caused by for example from crystal inaccuracies.

The AFC algorithm is operational only for frequency modulation such as 2-(G)FSK and 4-(G)FSK.

Due to the demodulation algorithm employed, any frequency error results in a DC offset in the demodulated signal before slicing.

The basic operating principle of the AFC is that the minimum and maximum signal frequencies are detected and a correction is calculated to remove the aforementioned offset.

Such correction is either applied at the slicer level in the form of offset compensation (default mode) or, optionally, is used to adjust the second IF conversion stage frequency. The former mode allows a quick recovery of the frequency error but does not prevent part of the received signal power to be cut by the channel filter; the latter mode adjusts the signal frequency before entering the channel filter thus avoiding power loss but requires a longer period to settle. The first mode is recommended for normal operation.

The AFC also provides the estimated frequency error through the AFC_CORR register. If the frequency error is known to be constant (for example communication always occurs between the same pair of devices), this value can directly be used to correct the programmed center frequency.

AFC_CORR register:

Fdig/(3*(2^13)) where Fdig is the frequency of the digital block(24, 25 o 26 MHz).

1 LSB is:

At 24 Mhz: 976.5625 Hz

At 25 Mhz: 1017.25260416 Hz

At 26 MHz: 1057.9427083 Hz

In order to guarantee both fast lock and smooth tracking, the AFC has a fast mode and a slow mode. The AFC starts in fast mode as soon as the RSSI threshold is passed and will switch to the slow mode after a programmable period.

The AFC is controlled by the following parameters:

- RSSI threshold: this parameter sets the minimum signal power above which the AFC algorithm is started (RSSI_TH register).
- AFC fast gain log2: this parameter sets the loop gain in the fast mode (AFC0 register), the range allowed is 0..15.
- AFC slow gain log2: this parameter sets the loop gain in the slow mode (AFC0 register), the range allowed is 0..15.
- AFC fast period: this parameter sets the length of the fast period in number of samples (AFC1 register), the range allowed is 0...255. The recommended setting for this parameter is such that the fast period equals the preamble length. Since the algorithm operates typically on 2 samples per symbol, the programmed value should be twice the number of preamble symbols. If this parameter is set to 0 then the switching from fast to slow mode is controlled by the sync word detection, for example the fast gain is used before the sync detection, the slow gain is used after sync detection.
- AFC mode: this parameter sets the AFC correction mode (AFC2 register. 0b: slicer correction, 1b: 2nd IF correction).
- AFC enable: this parameter enables the AFC algorithm (AFC2 register).

### 5.5.2 Automatic gain control

The automatic gain control (AGC for short) algorithm is designed to keep the signal amplitude at the input of the IF ADC within a specific range by controlling the gain of the RF chain in 6 dB steps, up to a maximum attenuation of 48 dB, starting at a received signal power of about -50 dBm.

From an implementation point of view, the (peak) signal amplitude is measured in the digital domain after the primary decimation filters chain and compared to a low threshold and to a high threshold. If the amplitude is above the high threshold, the attenuation is increased sequentially until the amplitude goes below the threshold; if the amplitude is below the low threshold, the attenuation is decreased sequentially until the amplitude goes above the threshold.

The AGC algorithm is controlled by the following parameters:

**High threshold**: this value sets the digital signal level above which the RF attenuation is increased (AGCCTRL1 register, allowed values 0...15). The recommended setting for such parameter is 0x5.

**Low thresholds**: this allows a better tuning of the low thresholds in case the analog attenuation steps have a significant spread around the nominal 6 dB attenuation. The threshold actually used for each step is selected through the bits of the LOW_THRESHOLD_SEL (AGCCTRL3) register. The recommended setting for Low Threshold 0 is 0x5, recommended setting for Low Threshold 1 is 0x4. The recommended value for LOW_THRESHOLD_SEL is 0x10.

**Measure time**: this parameter sets the measurement interval during which the signal level is monitored before the AGC attenuation is decreased. In particular, if the signal level is below the low threshold for all the duration of such period, then the attenuation is decreased.

The actual time is $T_{AGC\ meas} = \frac{12}{f_{dig}} \cdot 2^{MEAS\_TIME}$ , ranging from about 0.5 µs to about 15 ms.

For frequency modulation, the measurement time is normally set to a few µs in order to achieve fast settling of the algorithm.

For amplitude, to avoid an unstable behavior, the measure time must be larger than the duration of the longest train of ‘0’ symbols expected during the preamble/synchronization word.

The default value for such parameter is 0x2.

**Hold time**: this parameter sets a wait time for the algorithm to let the signal level to settle after a change in the attenuation level.

The actual time is $T_{AGC\ hold} = \frac{12}{f_{dig}} \cdot HOLD\_TIME$ , ranging from about 0.5 µs to about 32 µs.

The recommended setting for such parameter is 0x0C.

**AGC enable**: enables the AGC algorithm.

**Freeze on sync**: freeze the AGC level after when the sync word has been received.

The AGC algorithm works in the following way:

- If the amplitude is above the **high threshold,** the attenuation is increased sequentially until the amplitude goes below the threshold. In this case the $T_{meas}$ is set to 0 and only the hold time is used. Thus, if the signal is above the high threshold, the AGC word is changed each $T_{hold}$ seconds.
- If the amplitude is below the **low threshold,** the attenuation is decreased sequentially until the amplitude goes above the threshold. In this case the $T_{meas}$ is set to the value: $T_{hold}$ = (12*2MEAS_TIME)/$f_{dig}$. Thus, if the signal is below the low threshold, the AGC word is changed each $T_{meas}$ + $T_{hold}$ seconds.

The two operations are repeated in a loop until the input signal strength is between the high and the low threshold.

### 5.5.3 Symbol timing recovery

The S2-LP supports two different algorithms for the timing recovery. The selection of the algorithm is done with the register CLOCK_REC_ALGO_SEL.

- If CLOCK_REC_ALGO_SEL = 0, then a simple first order algorithm is used (shortly referred to as DLL).
- If CLOCK_REC_ALGO_SEL = 1, then a second order algorithm is used (shortly referred to as PLL).

Besides the configuration parameters mentioned above, the setting of the following registers also affects the behavior of the clock recovery algorithms.

- Post-filter length: this parameter controls the length of the demodulator post-filter (CLOCKREC register). Setting this value to 1B may improve demodulation performance but requires a slower recovery. The recommended value for such parameter is 0B.
- RSSI threshold: this parameter sets the minimum signal power above which the timing recovery is started (RSSI_TH register).

#### 5.5.3.1 *DLL mode*

The DLL algorithm, being based on a first order loop, is only able to control the delay of the local bit-timing generator in order to align it to the received bit period. If there is an error between the actual received bit period and the nominal one, the relative edges will drift over time and the algorithm will periodically apply a delay correction to recover. Since in presence of long sequences of zeroes or ones it is not possible to estimate any timing error, the loop tends to lose lock if the period error is large (greater than 3%).

The convergence speed of the loop is controlled by the CLK_REC_P_GAIN_FAST/SLOW parameter (KP) in the CLOCKREC1 and CLOCKREC2 registers with a smaller value yielding a faster loop. Allowed values for KP are from 0 to 7. The optimal values obtained for all modulations and data rates are KP = 1 or KP = 2.

#### 5.5.3.2 *PLL mode*

The PLL algorithm tracks the phase error of the local timing generator relative to received bit period and controls both frequency and phase to achieve the timing lock. Once that the relative period error has been estimated and corrected for example during the preamble phase, then even in presence of long sequences of zeroes or ones, the loop is able to keep lock.

In order to improve the performance of the algorithm, two sets of gain coefficients can be configured to be used before and after the sync word detection.

In particular, CLK_REC_I_GAIN_FAST and CLK_REC_P_GAIN_FAST are used before the SYNC while CLK_REC_I_GAIN_SLOW and CLK_REC_P_GAIN_SLOW are used after the SYNC detection.

### 5.5.4 RX channel filter bandwidth

The bandwidth of the receiver channel filter is programmable from 1 kHz to 800 kHz. The setting goes through the register CHFLT according to the following table.

Table 44. **Channel filter words**

| | E=0 | E=1 | E=2 | E=3 | E=4 | E=5 | E=6 | E=7 | E=8 | E=9 |
|---|---|---|---|---|---|---|---|---|---|---|
| M=0 | 800.1 | 450.9 | 224.7 | 112.3 | 56.1 | 28.0 | 14.0 | 7.0 | 3.5 | 1.8 |
| M=1 | 795.1 | 425.9 | 212.4 | 106.2 | 53.0 | 26.5 | 13.3 | 6.6 | 3.3 | 1.7 |
| M=2 | 768.4 | 403.2 | 201.1 | 100.5 | 50.2 | 25.1 | 12.6 | 6.3 | 3.1 | 1.6 |
| M=3 | 736.8 | 380.8 | 190.0 | 95.0 | 47.4 | 23.7 | 11.9 | 5.9 | 3.0 | 1.5 |
| M=4 | 705.1 | 362.1 | 180.7 | 90.3 | 45.1 | 22.6 | 11.3 | 5.6 | 2.8 | 1.4 |
| M=5 | 670.9 | 341.7 | 170.6 | 85.3 | 42.6 | 21.3 | 10.6 | 5.3 | 2.7 | 1.3 |
| M=6 | 642.3 | 325.4 | 162.4 | 81.2 | 40.6 | 20.3 | 10.1 | 5.1 | 2.5 | 1.3 |
| M=7 | 586.7 | 294.5 | 147.1 | 73.5 | 36.7 | 18.4 | 9.2 | 4.6 | 2.3 | 1.2 |
| M=8 | 541.4 | 270.3 | 135.0 | 67.5 | 33.7 | 16.9 | 8.4 | 4.2 | 2.1 | 1.1 |

The actual filter bandwidth for any digital clock frequency can be obtained by multiplying the values in the table above by the factor $\frac{f_{dig}}{26000000}$. The bandwidth values are intended as double-sided.

### 5.5.5 Intermediate frequency setting

The intermediate frequency (IF) can be tuned and be controlled by the registers IF_OFFSET_ANA and IF_OFFSET_DIG and can be set as follows:

**Intermediate frequency**

$$f_{IF} = \frac{f_{xo}}{12} \cdot \frac{(IF\_OFFSET\_ANA + 100)}{2^{11}} = \frac{fdig}{12} \cdot \frac{(IF\_OFFSET\_DIG + 100)}{2^{11}} \quad (15)$$

where $f_{XO}$ is the XTAL oscillator frequency and $f_{dig}$ is the digital clock frequency. The recommended IF value is about 300 kHz.

### 5.5.6 RX timer management

The programmable RX timer used can be configured using quality indicator to avoid unwanted interruption during a valid packet due to RX timer expiration. The quality indicators used to stop the RX timer are SQI, CS and PQI. More specifically, AND or OR Boolean relationships among any of them can be configured, to suit user application. In particular, it is required to include always SQI valid check, to avoid to stay in RX state for unlimited time, if timeout is stopped but no valid SQI is detected (in such cases, the RX state can be left using a SABORT command).

On timer expiration, reception aborts and the packet is discarded.

Table 45. **RX timer stop condition configuration**

| RX_TIMEOUT_AND_OR_SELECT | CS_TIMEOUT_MASK | SQI_TIMEOUT_MASK | PQI_TIMEOUT_MASK | Description |
|---|---|---|---|---|
| 0 | 0 | 0 | 0 | The RX timeout never expires and the reception ends at the reception of the packet |
| 1 | 0 | 0 | 0 | The RX timeout cannot be stopped. It starts at the RX state and at the end expires |
| X | 1 | 0 | 0 | RSSI above threshold |
| X | 0 | 1 | 0 | SQI above threshold (default) |
| X | 0 | 0 | 1 | PQI above threshold |
| 0 | 1 | 1 | 0 | Both RSSI AND SQI above threshold |
| 0 | 1 | 0 | 1 | Both RSSI AND PQI above threshold |
| 0 | 0 | 1 | 1 | Both SQI AND PQI above threshold |

| RX_TIMEOUT_AND_OR_SELECT | CS_TIMEOUT_MASK | SQI_TIMEOUT_MASK | PQI_TIMEOUT_MASK | Description |
|---|---|---|---|---|
| 0 | 1 | 1 | 1 | ALL above threshold |
| 1 | 1 | 1 | 0 | RSSI OR SQI above threshold |
| 1 | 1 | 0 | 1 | RSSI OR PQI above threshold |
| 1 | 0 | 1 | 1 | SQI OR PQI above threshold |
| 1 | 1 | 1 | 1 | ANY above threshold |

### 5.5.7 Receiver data modes

Direct modes are primarily intended to completely bypass the automatic packet handler, in order to give the user maximum flexibility in the choice of frame formats. Specifically:

- **Direct through FIFO mode**: the packet bytes are continuously received and written in the RX FIFO without any processing. It is the responsibility of the microcontroller to avoid any overflow conditions on the RX FIFO.
- **Direct through GPIO mode**: the packet bits are continuously written to one of the GPIO pins without any processing. To allow the synchronization of an external data sink, a data clock signal is also provided on one of the GPIO pins. Data are updated by the device on the falling edge of such clock signal so the MCU must read it during falling edge of CLK.

### 5.5.8 Receiver quality indicators

#### 5.5.8.1 *RSSI*

The measured RSSI is in steps of 1 dB, from 0 to 255 (1 byte value) and it is offset in such a way that the number 0 corresponds to -146 dBm, so the register value can be converted in dBm by subtracting 146. Laboratory calibration may be needed for accurate absolute power measurements. The RSSI value can be read through two registers: RSSI_LEVEL_CAPTURE and RSSI_LEVEL_RUN. In particular RSSI_LEVEL_CAPTURE reports the RSSI value captured at the end of the SYNC word detection, exit from RX state by SABORT command or RX timeout expiration, while RSSI_LEVEL_RUN is the continuous output of the RSSI filter. The last mode supports the continuous fast SPI reading that means if the CSn signal, of the SPI interface, is kept low, after the first 16 bits (S2-LP status register), then a new RSSI value will be available every 8 SPI clock cycles (this mode is the same of the SPI burst mode, but no automatic address increment).

#### 5.5.8.2 *Carrier sense*

The carrier sense functionality can be used to detect if any RF signal is being received, the detection is based on the measured RSSI value. There are two operational modes for carrier sensing: static and dynamic carrier sensing.

When static carrier sensing is used (CS_MODE = 0), the carrier sense signal is asserted when the measured RSSI is above the value specified in the RSSI_TH register and is de-asserted when the RSSI falls 3 dB below the same threshold.

When dynamic carrier sense is used (CS_MODE = 1, 2, 3), the carrier sense signal is asserted if the signal is above the threshold and a fast power increase of 6, 12 or 18 dB is detected; it is de-asserted if a power fall of the same amplitude is detected.

The carrier sense signal is also used internally to the demodulator to start the automatic frequency compensation and timing recovery algorithms and for the CSMA procedure (for this usage in should be set CS_MODE = 0).

The carrier sense function is controlled by the following parameters:

- RSSI threshold: this parameter sets the minimum signal power above which the carrier sense signal is asserted (RSSI_TH register).
- CS mode: this parameter controls the carrier sense operational modes.

**Table 46. CS mode description**

| CS_MODE | Description |
|---|---|
| 0 | Static carrier sensing |
| 1 | Dynamic carrier sensing with 6 dB dynamic threshold |

| CS_MODE | Description |
|---|---|
| 2 | Dynamic carrier sensing with 12 dB dynamic threshold |
| 3 | Dynamic carrier sensing with 18 dB dynamic threshold |

#### 5.5.8.3 *PQI*

The preamble quality indicator (PQI) is intended to provide a measurement of the reliability of the preamble detected. The PQI is increased by 1 every time a bit inversion occurs, while it is decreased by 4 every time a bit repetition occurs. The running peak PQI is compared to a threshold value and the preamble valid IRQ is asserted as soon as the threshold is passed. The preamble quality indicator threshold is 4 x PQI_TH (with PQI_TH = 0, 1, …15).

#### 5.5.8.4 *SQI*

The synchronization quality indicator (SQI) is a measurement of the best correlation between the received SYNC word and the expected one. This indicator is calculated as the peak cross-correlation between the received data stream and the expected SYNC word. If the SQI_EN = 1b, the running peak SQI is compared to a threshold value and the SYNC valid IRQ is asserted as soon as the threshold is passed. The SYNC quality threshold is equal to SYNC_LEN – 2 x SQI_TH (with SQI_TH = 0, 1, …7). When SQI_TH = 0b, perfect match is required. It is recommended the SQI check always enabled. The peak SQI value can be read from the register SQI[5:0] and represents the peak value from 0 to 32, while the bit SQI[6], when equal to '1' indicates that the SQI peak value refers to the secondary SYNC word.

### 5.5.9 CS blanking

The CS blanking feature prevents data to be received if the RSSI level on the air is below the RSSI threshold (set by the RSSI_TH field). The feature can be enabled through the CS_BLANKING bit in the ANT_SELECT_CONF register.

### 5.5.10 Antenna switching

The device implements a switching based antenna diversity algorithm. The antenna switching function allows controlling an external switch in order to select the antenna providing the highest measured RSSI. The switching decision is based on a comparison between the received power level on antenna 1 and antenna 2 during the preamble reception controlling through GPIO an external RF switch in order to select the antenna providing the highest measured RSSI.

When antenna switching is enabled, the two antennas are repeatedly switched during the reception of the preamble of each packet, until the carrier sense threshold is reached (static CS mode must be used). From this point on, the antenna with highest power is selected and switching is frozen. The switch control signal is available on GPIO and in the MC_STATE[1] register.

The algorithm is controlled by the following parameters:

- AS_MEAS_TIME: this register/parameter controls the time interval for RSSI measurement. The actual measurement time is done with the following formula.

**Antenna switching measurement time**

$$T_{meas} = \frac{24 \cdot 2^{CHFLT\_E} \cdot 2^{AS\_MEAS\_TIME}}{f_{dig}} \quad (16)$$

In case of FSK modulation, the whole $T_{meas}$ is used to let the signal level settle after the antenna switch and one single measurement is taken at the end of such period.

In case of OOK modulation, after one first interval equal to $T_{meas}$ again used to let the signal level settle after the antenna switch, one second interval still equal to $T_{meas}$ , is used to perform a peak power measurement and select the best antenna.

- AS_ENABLE: this parameter enables the antenna switching function.

## 5.6 Transmitter

The S2-LP contains an integrated PA capable of transmitting at output levels programmable between -30 dBm to +14 dBm (+16 dBm in boost mode), at step of 0.5 dB.

The PA is single-ended and has a dedicated pin (TXOUT). The PA output is ramped up and down to prevent unwanted spectral splatter. In TX mode the PA drives the signal generated by the frequency synthesizer out to the antenna terminal. Delivered power, as well as harmonic content, depends on the external impedance seen by the PA. It is possible to program TX to send an unmodulated carrier.

The output stage is supplied from the SMPS through an external choke and is loaded with a LC-type network which has the function of transforming the impedance of the antenna and filter out the harmonics. The TX and RX pins are tied directly to share the antenna. During TX, the LNA inputs are internally shorted to ground to allow for the external network resonance, so minimizing the power loss due to the RX.

### 5.6.1 PA configuration

The PA output power level is programmable in 0.5 dB steps. The user can store up to eight output levels to provide flexible PA power ramp-up and ramp-down at the start and end of a frequency modulation transmission as well as ASK modulation shaping.

With the digital power-ramping enabled (PA_RAMP_EN = 1 in the PA_POWER0 register) the ramp starts from the minimum output power programmed and stops at the programmed maximum value, thus a maximum of 8 steps can be set up as shown in Figure 10. Output power ramping configuration. The interpolation factor ranges from 64 down to 1 depending on the actual data rate. The assumption is that output power monotonically decrease. Each step is held for a programmable time interval expressed in terms of bit period units ($T_b/8$), maximum value is 3 (which means $4 \times T_b/8 = T_b/2$). Therefore, the PA ramp may last up to 4 $T_b$ (about 3.3 ms if the bit rate is 1.2 kbit/s).

$$T_{ramp} = \frac{(PA\_RAMP\_STEP\_LEN + 1) \times (PA\_LEVEL\_MAX\_IDX + 1)}{8 \times DataRate} \quad (17)$$

where *DataRate* is the transmission data rate expressed in symbols/s.

The set of eight levels is used to shape the ASK signal. In this case, the modulator works as a counter that counts when transmitting a one and down when transmitting a zero. The counter counts at a rate equal to 8 times the symbol rate (in this case, the step width is fixed by symbol rate).

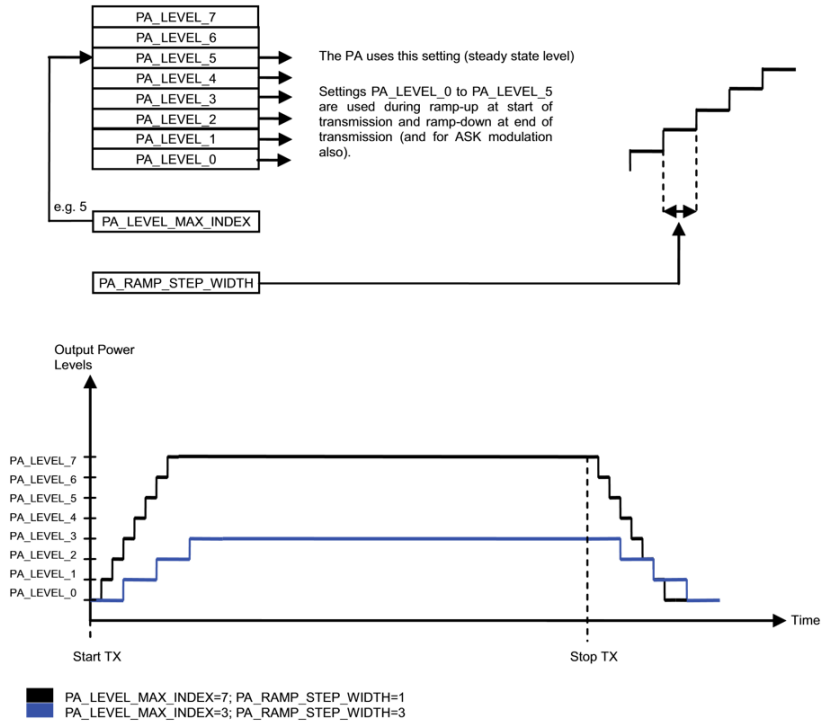
For OOK modulation, the signal is abruptly switched between two levels only: no power and maximum. This mode is obtained setting the PA_RAMP_EN=0.

With the digital power-ramping, the digital PA interpolation can be enabled through the PA_INTERP_EN field of the MOD1 register.

When this feature is enabled, the power values specified in the PA_POWER registers are linearly interpolated by the modulator before being applied to the PA.

The mathematical interpolation factor applied at each output sample is 64 for data rates corresponding to DATA_RATE_E < 5, it is then automatically scaled as $\frac{64}{2^{DATA\_RATE\_E - 5}}$ and it is automatically disabled for DATA_RATE_E = 11.

Figure 10. **Output power ramping configuration**



### 5.6.2 Transmitter data modes

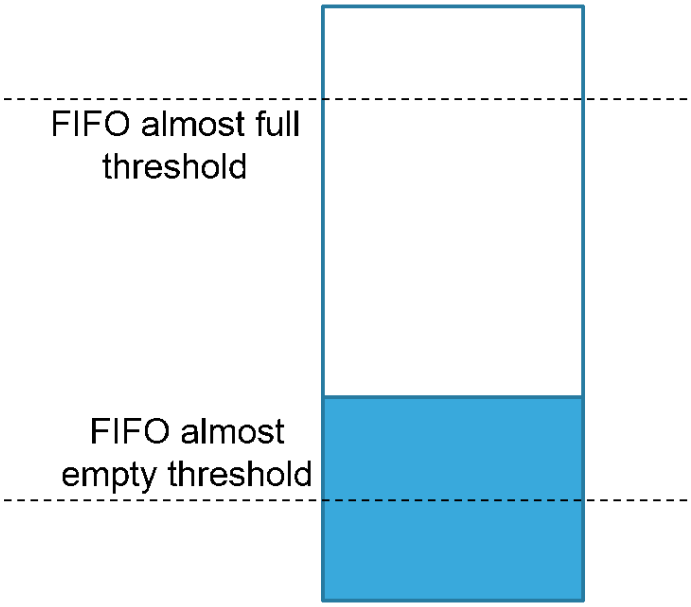
Direct modes are primarily intended to completely bypass the automatic packet handler, in order to give the user maximum flexibility in the choice of frame formats. In specific:

- **Direct through FIFO mode**: the packet is written in TX FIFO. The user build the packet according to his need including preamble, payload and soon on. The data are transmitted without any processing.
- **Direct through GPIO mode**: the packet bits are continuously read from one of the GPIO pins, properly configured, and transmitted without any processing. To allow the synchronization of an external data source, a data clock signal is also provided on one of the GPIO pins. Data are sampled by the device on the rising edge of such clock signal; it is the responsibility of the external data source to provide a stable input at this edge.
- **PN9 mode**: a pseudo-random binary sequence is generated internally. This mode is provided for test purposes only.

### 5.6.3 Data FIFO

In the S2-LP there are two data FIFOs, a TX FIFO for data to be transmitted and an RX FIFO for the received data both of 128 bytes. The SPI interface is used to read from the RX FIFO and write to the TX FIFO starting from the address 0xFF.

Figure 11. **Threshold in FIFO**



The TX FIFO has two programmable thresholds (see figure above). An interrupt event occurs when the data in the TX FIFO reaches any of these thresholds. The first threshold is the “FIFO Almost Full” threshold, TX_AF_THR registers. The value in this field corresponds to the desired threshold value in number of bytes + 2. When empty locations (free) amount inside the TX FIFO reaches this threshold limit, an interrupt to the MCU is generated so it can send a TX command to transmit the contents of the TX FIFO. The second threshold for TX is the “FIFO Almost Empty” threshold, TX_AE_THR register. When the data being shifted out of the TX FIFO reaches the Almost Empty threshold, an interrupt will be generated also. The MCU could to switch out of TX mode or fill new data into the TX FIFO.

The RX FIFO has two programmable thresholds (see figure above). The first threshold is the “FIFO Almost Full” threshold, RX_AF_THR0 registers. The value in this register corresponds to the desired threshold value in number of bytes. When empty locations (free) amount inside the RX FIFO reaches this threshold limit, an interrupt will be generated to the MCU. The MCU should then start to read the data from the RX FIFO. The second threshold for RX is the “FIFO Almost Empty” threshold, RX_AE_THR register. When the data being shifted out of the RX FIFO reaches the Almost Empty threshold, an interrupt will be generated also. The MCU will need to switch on RX mode to fill with new data the RX FIFO or stop to read after the number of byte indicated by the RX_AE_THR register.

In order to enable the RX_FIFO thresholds interrupts, the bit FIFO_GPIO_OUT_MUX_SEL (PROTOCOL2 register) must be set to 1. To enable the TX_FIFO thresholds interrupts the FIFO_GPIO_OUT_MUX_SEL must be set to 0.

The FIFO controller detects overflow or underflow in the RX FIFO and overflow or underflow in the TX FIFO. It is the responsibility of the MCU to avoid TX FIFO overflow since the MCU only can decide to writing on the TX FIFO. A TX FIFO overflow results in an error in the TX FIFO content, while an underflow results in the continuous transmission of the last byte stored in the TX FIFO. Likewise, when reading the RX FIFO the MCU must avoid reading the RX FIFO after its empty condition is reached, since a RX FIFO underflow will result in an error in the data read out of the RX FIFO.

When an overflow or an underflow is detected, the MCU has to issue a SABORT and a FLUSHTXFIFO/ FLUSHRXFIFO command before resuming the normal transceiver activity. For each FIFO, when one of these errors is detected an interrupt is generated to the MCU.

The S2-LP is capable of automatically retransmitting the last packet that was stored into the FIFO (if NMAX_RETX > 0 in the PROTOCOL register and no new packet is loaded into the TX FIFO between successive re-transmissions). This feature is useful for “beacon” transmission or when retransmission is required due to absence of a valid acknowledgement. Only packets that fit completely in the TX FIFO are valid for the retransmit feature. When the packet is longer than 128 bytes, the FIFO content after the transmission is only the last part of the payload. In this case, the FIFO must be reloaded by the MCU.

The TX FIFO may be flushed by issuing a FLUSHTXFIFO command (see Table 49. Commands). Similarly, a FLUSHRXFIFO command flushes the RX FIFO.

The full / empty status of the TX / RX FIFO is readable on the bits [9:8] of the MC_STATE registers, and at the same time, the related IRQs are generated.

In the SLEEP state, the FIFO content is retained only if the SLEEP_B mode is selected (bit SLEEP_MODE_SEL=1 in the register 0x79).

## 5.7 Integrated RCO

The S2-LP contains an ultra-low power RC oscillator with accuracy better than 1%. The RC oscillator frequency is calibrated using as a reference the XO frequency. It depends on two values: raw (4 bits) and fine (5 bits). The raw value is obtained by a linear search algorithm in which for each value a counting of half clock reference inside the period of RCO is done. When the correction is near to the final value, a dichotomy search algorithm starts.

The RCO calibration starts as soon as the RCO_CALIBRATION bit is set to 1. When it finishes, the RC_CAL_OK bit is set and the ERROR_LOCK bit is reset.

Moreover, after a sleep or standby state, if the RCO_CALIBRATION bit is kept to 1, when the device returns to the ready state, an RCO calibration automatically runs to compensate some drift.

It is possible to perform an offline calibration of the RCO using the following procedure:

1. Enable the RCO CALIB setting the bit to 1
2. Wait until the RC_CAL_OK becomes 1
3. Copy the RWT_OUT and RFB_OUT (registers 0x94 and 0x95) out values in the RWT_IN and RFB_IN fields (registers 0x6E and 0x6F)
4. Disable the RCO CALIB setting the bit to 0

In this way, the RCO will work with these values. It is advisable to repeat the RCO calibration to reject effects related to the variation of temperature. It is recommended to use this procedure if the following SLEEP time (i.e. when using LDC mode) is shorter or comparable to the calibration time.

By default, the calibration is disabled at reset to avoid using an out-of-range reference frequency, after the internal clock divider is correctly configured, the user can enable the RCO calibration by register.

Once calibrated, the RCO generates a clock frequency that depends on the XO frequency used:

**Table 47. RCO Frequency**

| Ref. frequency [MHz] | RCO frequency [kHz] |
|---|---|
| 24 or 48 | 32 |
| 25 or 50 | 33.33 |
| 26 or 52 | 34.66 |

## 5.8 Low battery indicator

The battery indicator can provide the user with an indication of the battery voltage level.

There are two blocks to detect battery level:

- Brownout with a fixed threshold
- Battery level detector with a programmable threshold

The MCU enables optionally these blocks to provide an early warning of impending power failure. It does not reset the system, but gives the MCU time to prepare for an orderly power-down and provides hardware protection of data stored in the program memory.

The low battery indicator function is available in any of the S2-LP operation modes. As this function requires the internal bias circuit operation, the overall current consumption in STANDBY, SLEEP, and READY modes increase by 400 µA.

## 5.9 Voltage reference

This block provides the precise reference voltage needed by the internal circuit.

# 6 Operating modes

The S2-LP is provided with a built-in main controller which controls the switching between the two main operating modes: transmitter (TX) and receiver (RX), driven by SPI commands.

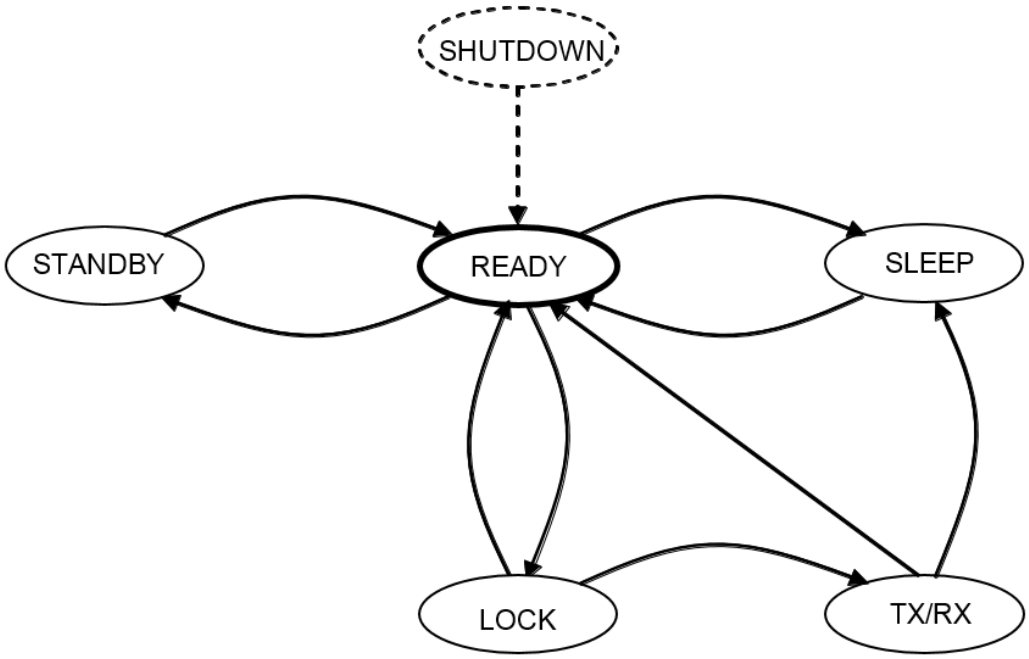
In shutdown condition (the S2-LP can be switched on/off with the external pin SDN), no internal supply is generated, and all stored data and configurations are lost.

From shutdown, the S2-LP can be switched on going to READY state, where the reference clock signal is available.

From READY state, the S2-LP can be moved to LOCK state to generate the high precision LO signal and then in TX or RX modes. Switching from RX to TX and vice versa can happen only by passing through the LOCK state. This operation is managed by the main controller through a single user command (TX or RX). At the end of the operations, the S2-LP can return to READY state or can go to SLEEP state, having a very low power consumption.

SLEEP state can be configured to retain the FIFOs content or not enabling very low power mode. If also no wake-up timer is required, the S2-LP can be moved from READY to STANDBY state, which has the lowest possible current consumption.

**Figure 12. State diagram**



Three states: READY, STANDBY and LOCK may be defined as stable state.

All other states are transient, which means that, in a typical configuration, the controller remains in those states, at most for any timeout timer duration. Also the READY and LOCK states behave as transients when they are not directly accessed with the specific commands (for example, when LOCK is temporarily used before reaching the TX or RX states).

SYNTH_SETUP is a stable state that can be accessed if the SABORT command is sent out of its recommended states of execution. If, during SLEEP state, a pair of SABORT and RX (or TX) commands are sent to the device, the device remains in SLEEP, but an incoming READY command leads the device to enter SYNTH SETUP state.

Table 48. **State description**

| State code | State name | Description |
|---|---|---|
| NA | SHUTDOWN | No internal power supply is generated |
| 0x02 | STANDBY | No wake-up timer active |
| 0x01 | SLEEP_A | Wake-up timer active, no FIFO retention |
| 0x03 | SLEEP_B | Wake-up timer active, FIFO retention |
| 0x00 | READY | Radio in ready state |
| 0x14 | LOCKST | Error state due to a failure in LOCK operation |
| 0x0C | LOCKON | High precision LO signal available |
| 0x30 | RX | Radio in receiver mode |
| 0x5C | TX | Radio in transmitter mode |
| 0x50 | SYNTH_SETUP | Non desirable state reached when a pair of SABORT and RX (or TX) commands are sent during SLEEP state and before sending the READY command |
| 0x7C | WAIT_SLEEP | State entered if, in LDC RX mode, at least one interrupt is generated at the end of the RX cycle |

Commands are used in the S2-LP to change the operating mode and to use its functionality. A command is sent on the SPI interface and may be followed by any other SPI access without pulling CSn high. A command code is the second byte to be sent on the MOSI pin (the first byte must be 0x80). The commands are immediately valid after SPI transfer completion (no need for any CSn positive edge).

## 6.1 Command list

Table 49. **Commands**

| Command code | Command name | State for execution | Description |
|---|---|---|---|
| 0x60 | TX | READY, SYNTH_SETUP | Send the S2-LP to TX state for transmission |
| 0x61 | RX | READY, SYNTH_SETUP | Send the S2-LP to RX state for reception |
| 0x62 | READY | STANDBY, SLEEP, LOCK | Go to READY state |
| 0x63 | STANDBY | READY, SYNTH_SETUP | Go to STANDBY state |
| 0x64 | SLEEP | READY, SYNTH_SETUP | Go to SLEEP state |
| 0x65 | LOCKRX | READY, SYNTH_SETUP | Go to LOCK state by using the RX configuration of the synthesizer |
| 0x66 | LOCKTX | READY, SYNTH_SETUP | Go to LOCK state by using the TX configuration of the synthesizer |
| 0x67 | SABORT | TX, RX | Exit from TX or RX states and go to READY state |
| 0x68 | LDC_RELOAD | ANY | Reload the LDC timer with a pre-programmed value stored in registers |
| 0x70 | SRES | ANY | Reset the S2-LP state machine and registers values |
| 0x71 | FLUSHRXFIFO | All | Clean the RX FIFO |
| 0x72 | FLUSHTXFIFO | All | Clean the TX FIFO |
| 0x73 | SEQUENCE_UPDA TE | ANY | Reload the packet sequence counter with the value stored in register |

## 6.2 State transaction response time

Table 50. **Response time**

| Initial state | Final state | Response time [µs] |
|---|---|---|
| SHUTDOWN | READY | 500 |
| READY | STANDBY/ SLEEP | 3 |
| READY | LOCK with no VCO calibration | 70 |
| READY | LOCK with VCO calibration | 85 |
| RX/TX | READY | 1 |
| STANDBY/SLEEP | READY | 100 |
| LOCK | RX/TX | 26 |

*Note: The transition time enables the S2-LP for frequency hopping operation due to its reduced response time and very quick programming synthesizer. The response time depends on frequency of the clock in digital domain, from 24 MHz to 26 MHz.*

*Note: The first bit of preramble is sent after TX state is reached, if PA ramping is not enabled. If PA ramping is enabled, the first bit is sent after tramp (see Section 5.6.1 PA configuration).*

## 6.3 Sleep states

S2-LP provides 2 SLEEP states:

- SLEEP without FIFO retention (SLEEP_A): in this low power state, the device keeps all the register values but not the TX and RX FIFOs. This is the device default SLEEP state.
- SLEEP with FIFO retention (SLEEP_B): in this low power state, the device keeps the content of the registers and the two FIFOs.

The responsibility of the SLEEP type to be used is demanded to the user. To select the SLEEP mode, the bit SLEEP_MODE_SEL (register 0x79) can be used. If this bit is set to 0, SLEEP_A is used each time the device enters SLEEP (by SPI command, LDC flow or CSMA in non-persistent mode). If it is 1, SLEEP_B is used instead.

The usage of SLEEP_B mode is mandatory in the configuration like CSMA and LDC in Tx.

# 7 Packet handler engine

The S2-LP offers a highly flexible and fully programmable packet handler (framer and de-framer) that build the packet according to the user configuration settings. The packet types are available: BASIC format, STack format in which auto acknowledgment and auto retransmission is used, 802.15.4g packet format and UART over the air packet format.

WMBUS format is supported but it can be obtained using the proper features combination.

The RX packet handler is in charge of treating the raw bits produced by the demodulator. The main functions of the RX packet handler are:

- Detect a valid preamble
- Detect a valid synchronization word and start-of-frame
- Extract all packet fields according to the selected packet format
- Perform error correction and interleaving
- Calculate the local CRC and compare to the received one

The device supports 4 different packet formats. The current packet format is set by the PCK_FRMT field of the PCKTCTRL3 register.

In particular:

- 0: Basic packet format
- 1: 802.15.4g packet format
- 2: UART over the air packet format
- 3: STack packet format

## 7.1 BASIC packet format

The packet format BASIC is selected by writing 0b in the register PCK_FRMT. The packet frame is as follows:

**Table 51. BASIC packet format**

| Preamble | Sync | Length | Address | Payload | CRC | Postamble |
|---|---|---|---|---|---|---|
| 0:2046 bits | 0:32 bits | 0:2 bytes | 0:1 bytes | 0:65535 bytes | 0:4 bytes | 0:510 bits |

- **Preamble**: each preamble is a pair of ‘01’ or ‘10’ from 0 pair to 1023 pairs, programmed by the register PREAMBLE_LENGTH. The binary sequences transmitted in the various modulation modes are summarized in the following table (leftmost bit is transmitted first).

**Table 52. Preamble field selection**

| PREAMBLE_SEL | 2(G)FSK or OOK/ASK | 4(G)FSK |
|---|---|---|
| 0 | 0101 | 0111 |
| 1 | 1010 | 0010 |
| 2 | 1100 | 1101 |
| 3 | 0011 | 1000 |

- **Sync**: the pattern that identify the start of the frame can be configured in value with a programmable length from 0 to 32 bits, in steps of 1-bit length. The setting is done by the register SYNC_LENGTH. The S2LP supports dual synchronization with a either a primary or a secondary synchronization word. The binary content of the primary SYNC word is programmable through registers SYNCx (x= 0, 1, 2, 3). The binary content of the secondary SYNC word is programmable through registers SEC_SYNCx (x= 0, 1, 2, 3), note that such registers are in alternate use with address filtering registers. On the transmitter side either the primary or the secondary word is transmitted according to the value of the SECONDARY_SYNC_SEL register, in particular if SECONDARY_SYNC_SEL = 0 then the primary synchronization word is transmitted; if SECONDARY_SYNC_SEL = 1 then the secondary synchronization word is transmitted. On the receiver side, the primary synchronization word is always enabled. The search for the secondary synchronization word can be enabled setting SECONDARY_SYNC_SEL = 1b. In this case, both the binary patterns are searched for and both of them can trigger the start of payload demodulation. The SQI[5:0] value reported in the LINQ_QUALIF register is the maximum between the SQI of the primary and secondary words. The bit SQI[6] indicates which synchronization word has been detected: in particular, if the secondary synchronization word has been detected then the SQI[6] = 1b otherwise if the primary synchronization word has been detected then SQI[6] = 0b. The binary pattern programmed in SYNCx (or SEC_SYNCx) is transmitted on air starting with the most significant bit of x = 1, to the least significant bit of x = 4 according to the programmed synchronization word length.
- **Length**: The device supports both fixed and variable packet length transmission from 0 to 65535 bytes. On the transmitting device, the packet length is always set by using the two registers PCKTLENx (x= 1, 2) as: PCKTLEN1 × 256 + PCKTLEN0. On the receiving device, if FIX_VAR_LEN register is set to '1', the packet length is directly extracted from the field Length of the received packet itself. If the register FIX_VAR_LEN = 0b the Length field of the received packet is not used, because is already known from the registers PCKTLENx (x= 1, 2) as for the transmitter. For the basic and stack packet formats, the number of address bytes is also counted in the packet length value. CRC is excluded. Furthermore, when variable packet length is used (FIX_VAR_LEN=1b), the width of the binary field transmitted, must be configured through the LEN_WID register in the following way:
  - If the packet length is from 0 to 255 bytes (payload + address field), then LEN_WID = 0b (1 byte length field transmitted).
  - If the packet length is from 0 to 65535 bytes (payload + address field), then LEN_WID = 1b (2 bytes length field transmitted).
- **Destination address**: can be enabled or no by the register ADDRESS_LEN. If enabled, ADDRESS_LEN=1b, its size is 1 byte. The destination address field is read from the register RX_SOURCE_ADDR (TX only). The receiver uses this field to perform automatic filtering on its value programmed in TX_SOURCE_ADDR (RX only).
- **Payload**: the main data from transmitter with a max length up to 65535 supported by the embedded automatic packet handler.
- **CRC**: can optionally be calculated on the transmitted data (Length field, Address field and Payload) and appended at the end of the payload (see Section 7.9 CRC).
- **Postamble**: The packet postamble allows inserting a certain number of '01' bit pairs at the end of the data packet. The number of postamble bit pairs can be set through the MBUS_PSTMBL register.

## 7.2 STack packet

**Table 53. STack packet**

| Preamble | Sync | Length | Dest. address | Src address | Seq num | NO_ACK | Payload | CRC | Postamble |
|---|---|---|---|---|---|---|---|---|---|
| 0:2046 bits | 0:32 bits | 0:2 bytes | 1 bytes | 1 bytes | 2 bits | 1 bit | 0:65535 bytes | 0:4 bytes | 0:510 bits |

- **Preamble**: each preamble is a pair of '01' or '10' from 0 pair to 1023 pairs, programmed by the register PREAMBLE_LENGTH. The binary sequences transmitted in the various modulation modes are summarized in Table 52. Preamble field selection (leftmost bit is transmitted first).

- **Sync**: the pattern that identify the start of the frame can be configured in value with a programmable length from 0 to 32 bits, in steps of 1-bit length. The setting is done by the register SYNC_LENGTH. The S2LP supports dual synchronization with a either a primary or a secondary synchronization word. The binary content of the primary SYNC word is programmable through registers SYNCx (x= 0, 1, 2, 3). The binary content of the secondary SYNC word is programmable through registers SEC_SYNCx (x= 0, 1, 2, 3), note that such registers are in alternate use with address filtering registers. On the transmitter side either the primary or the secondary word is transmitted according to the value of the SECONDARY_SYNC_SEL register, in particular if SECONDARY_SYNC_SEL = 0 then the primary synchronization word is transmitted; if SECONDARY_SYNC_SEL = 1 then the secondary synchronization word is transmitted. On the receiver side, the primary synchronization word is always enabled. The search for the secondary synchronization word can be enabled setting SECONDARY_SYNC_SEL = 1b. In this case, both the binary patterns are searched for and both of them can trigger the start of payload demodulation. The SQI[5:0] value reported in the LINK_QUALIF register is the maximum between the SQI of the primary and secondary words. The bit SQI[6] indicates which synchronization word has been detected: in particular, if the secondary synchronization word has been detected then the SQI[6] = 1 otherwise if the primary synchronization word has been detected then SQI[6] = 0. The binary pattern programmed in SYNCx (or SEC_SYNCx) is transmitted on air starting with the most significant bit of x = 1, to the least significant bit of x = 4 according to the programmed synchronization word length.
- **Length**: The device supports both fixed and variable packet length transmission from 0 to 65535 bytes. On the transmitting device, the packet length is always set by using the two registers PCKTLENx (x= 1, 2) as: PCKTLEN1 × 256 + PCKTLEN0. On the receiving device, if FIX_VAR_LEN register is set to ‘1’, the packet length is directly extracted from the field Length of the received packet itself. If the register FIX_VAR_LEN = 0b the Length field of the received packet is not used, because is already known from the registers PCKTLENx (x= 1, 2) as for the transmitter. Furthermore, when variable packet length is used (FIX_VAR_LEN=1b), the width of the binary field transmitted, must be configured through the LEN_WID register in the following way:
  - If the packet length is from 0 to 255 bytes (payload + address field), then LEN_WID = 0 (1 byte length field transmitted).
  - If the packet length is from 0 to 65535 bytes (payload + address field), then LEN_WID = 1 (2 bytes length field transmitted).
- **Destination address**: the receiver uses this field to perform automatic filtering on its value. It is a mandatory field always on. The destination address field is read from the register RX_SOURCE_ADDR (TX only).
- **Source address**: the receiver uses this field to perform automatic filtering on its value. It is a mandatory field always on. The source address field is read from the register TX_SOURCE_ADDR (TX only).
- **Sequence number**: it is a 2 bits field and contains the sequence number of the transmitted packet. It is incremented automatically every time a new packet is transmitted. It can be manually updated with the SEQUENCE_UPDATE command. Since the S2-LP loses the sequence number, it is necessary to store it on the MCU at the end of the transaction and then recover it after the stand-by session.
- **NO_ACK**: it is 1 bit field that notify to the receiver if the packet has to be acknowledged or not. This bit must be used only in STack packet format.
- **Payload**: the main data from transmitter with a max length up to 65535 supported by the embedded automatic packet handler.
- **CRC**: can optionally be calculated on the transmitted data (Length field, Destination Address field, Source Address field, Sequence Number, No Ack and Payload) and appended at the end of the payload (see Section 7.9 CRC).
- **Postamble**: The packet postamble allows inserting a certain number of ‘01’ bit pairs at the end of the data packet. The number of postamble bit pairs can be set through the MBUS_PSTMBL register.

## 7.3 802.15.4g packet

**Table 54. 802.15.4g packet**

| Preamble | Sync | PHR | MHR + MAC payload | CRC |
|---|---|---|---|---|
| 0:2046 bits | 0:32 bits | 2 bytes | 2:2047 bytes | 0:4 bytes |

- **Preamble**: each preamble is a pair of ‘01’ or ‘10’ from 0 pair to 1023 pairs ( in the table we write 2046 bits), programmed by the register PREAMBLE_LENGTH. The binary sequences transmitted in the various modulation modes are summarized in Table 52. Preamble field selection (leftmost bit is transmitted first).
- **Sync**: the pattern that identify the start of the frame can be configured in value with a programmable length from 0 to 32 bits, in steps of 1-bit length. The setting is done by the register SYNC_LENGTH. The S2LP supports dual synchronization with a either a primary or a secondary synchronization word. The binary content of the primary SYNC word is programmable through registers SYNCx (x= 0, 1, 2, 3). The binary content of the secondary SYNC word is programmable through registers SEC_SYNCx (x= 0, 1, 2, 3), note that such registers are in alternate use with address filtering registers. On the transmitter side either the primary or the secondary word is transmitted according to the value of the SECONDARY_SYNC_SEL register, in particular if SECONDARY_SYNC_SEL = 0, the primary synchronization word is transmitted; if SECONDARY_SYNC_SEL = 1 then the secondary synchronization word is transmitted. On the receiver side, the primary synchronization word is always enabled. The search for the secondary synchronization word can be enabled setting SECONDARY_SYNC_SEL = 1b. In this case, both the binary patterns are searched for and both of them can trigger the start of payload demodulation. The SQI[5:0] value reported in the LINK_QUALIF register is the maximum between the SQI of the primary and secondary words. The bit SQI[6] indicates which synchronization word has been detected: in particular, if the secondary synchronization word has been detected then the SQI[6] = 1b otherwise if the primary synchronization word has been detected then SQI[6] = 0b. The binary pattern programmed in SYNCx (or SEC_SYNCx) is transmitted on air starting with the most significant bit of x = 1, to the least significant bit of x = 4 according to the programmed synchronization word length. For the 802.15.4g packet format, the secondary synchronization word is automatically selected on the TX side only, when FEC is enabled (FEC_EN = 1) and the setting of SECONDARY_SYNC_SEL is ignored.
- **PHR**: The PHR (physical header) field is specific for the 802.15.4g packet format and is automatically built by the packet handler block based on current register configuration.

**Table 55. PHR frame**

| Bit string index | 0 | 1-2 | 3 | 4 | 5-15 |
|---|---|---|---|---|---|
| Bit mapping | MS | $R_1$-$R_0$ | FCS | DW | $L_{10}$-$L_0$ |
| Field name | Mode switch | Reserved | FSC type | Data whitening | Frame length |

In particular:

- MS is always set to 0b (mode switch not supported).
- $R_1$-$R_0$ are always set to 00b.
- FCS is set to:
  - 0b if CRC mode 5 is selected.
  - 1b if CRC mode 3 is selected.
- DW is set to:
  - 0b if whitening is disabled, register WHIT_EN = 0.
  - 1b if whitening is enabled, register WHIT_EN = 1.
- $L_{10}$-$L_0$ are set equal to the 11 bits LSB of the packet length registers set by using the two registers PCKTLENx (x= 1, 2) as: PCKTLEN1 × 256 + PCKTLEN0. The packet length is from 0 to 65535 bytes (MHR + MAC Payload + CRC), then LEN_WID = 1b (2 byte length field transmitted).
- **Payload**: the main data from transmitter with a max length up to 65535 supported by the embedded automatic packet handler.
- **CRC**: can optionally be calculated on the transmitted data (MHR + MAC Payload) and appended at the end of the payload (see Section 7.9 CRC)

- In the 802.15.4g the CRC, named FCS in the standard, is considered part of the PSDU (PHY payload) hence the packet length, must include the 2 or 4 CRC bytes:
  - If the packet length programmed in PCKTLEN1 and PCKTLEN0 is L and CRC mode is 3, then L-2 bytes are read/written from/to the TX/RX FIFO and interpreted as MHR + MAC Payload, 2 bytes CRC are automatically calculated and inserted at the end of the packet in transmission and stripped in reception.
  - If the packet length programmed in PCKTLEN1 and PCKTLEN0 is L and CRC mode is 5, then L-4 bytes are read/written from/to the TX/RX FIFO and interpreted as MHR + MAC Payload, 4 byte CRC are automatically calculated and inserted at the end of the packet in transmission and stripped in reception.
  - If CRC mode is 0, then L bytes are read/written from/to the TX/RX FIFO and interpreted as MHR + MAC Payload + MCS. In this case no CRC calculation, insertion/stripping is done, and it is the responsibility of the MAC layer to process it.

For CRC mode 3, according to the standard specifications, the CRC output is complemented to 1 before transmission.

For CRC mode 5, if the payload length is less than 4 bytes then the payload is zero-padded to reach a minimum length of 4 bytes. The padding bits are only used to compute the CRC and are not transmitted on-air. The reverse operation is automatically performed on the receiver.

## 7.4 UART over the air packet format

**Table 56. UART over the air packet format**

| Preamble | Sync | Payload |
|---|---|---|
| 0:2046 bits | 0:32 bits | 0:65535 bytes |

When this format is selected, a start bit and a stop bit can be programmed to be added to each byte of the TX FIFO. Such start and stop bits are automatically removed from the received payload before written to the RX FIFO. Start and stop bits are not added to the SYNC word.

Also, the BYTE_SWAP bit can be set in order to send the FIFO bytes in LSbit first (default is indeed MSbit first).

The actual binary value of the start and stop bit can be set through the START_BIT and the STOP_BIT fields of the PCKTCTRL2 register.

## 7.5 Wireless MBUS packet (W-MBUS, EN13757-4)

The W-MBUS packet structure referred to EN13757 can be obtained through registers setting programming the basic packet to fit the specific sub-mode used.

| Preamble | Sync | 1st block | 2nd block | Opt. blocks | Postamble |
|---|---|---|---|---|---|

**Preamble**: the preamble is fully programmable to fit the W-MBUS protocol. The generic setting is a pair of ‘01’ or ‘10’ from 1 pair to 1024 pairs (max. 256 bytes).

**Sync**: the pattern that identify the start of the frame is fully programmable to fit the W-MBUS protocol. The generic setting is in value with a programmable length from 1 bit to 64 bytes, in steps of 1-bit length.

**Data blocks**: the data coding can be fully programmed in NRZ, Manchester or 3-out-of-6.

**Postamble**: The packet postamble allows inserting a certain number of ‘01’ bit pairs at the end of the data packet. The number of postamble bit pairs can be set through the MBUS_PSTMBL register depending on the chosen sub-mode according to the W-MBUS protocol.

## 7.6 Payload transmission order

The bit order of the data from TX FIFO and written into the RX FIFO is controlled by the BYTE_SWAP register. In particular, the transmission is MSB first if BYTE_SWAP = 0 and LSB first if BYTE_SWAP = 1.

## 7.7 Automatic packet filtering

The receiver uses the following filtering criteria to reject the received packet. The automatic filtering is supported in BASIC and STack packet format only.

- **CRC**: the received packet is discarded if CRC check fails. Both transmitter and receiver must be configured with same CRC polynomial.
- **Destination address vs my address**: the received packet is discarded if the destination address field received does not match the programmed my address of the receiver.
- **Destination address vs. broadcast address**: the received packet is discarded if the destination address field received does not match the programmed broadcast address of the receiver.
- **Destination address vs. multicast address**: the received packet is discarded if the destination address field received does not match the programmed multicast address of the receiver.
- **Source address**: the received packet is discarded if the source address received does not match the programmed source address reference (a bit mask can be included). Supported in STack packet format only.

The automatic filtering can be programmed to discard packet below certain threshold settings. These kind of filtering are general purpose and can be used with any packet format.

- **Carrier sense**: The carrier sense (CS) functionality detects if any signal is being received, the detection is based on the measured RSSI value. There are 2 operational modes for carrier sensing: static and dynamic. In static CS mode, the CS is high when the measured RSSI is above the RSSI threshold specified and is low when the RSSI is 3 dB below the threshold. In dynamic CS mode, the CS is high if the signal is above the threshold and a fast power increase of 6, 12, or 18 dB is detected. The CS is also used internally for the demodulator to start the AFC and timing recovery algorithms and for the CSMA procedure (static CS mode only).
- **PQI**: It is possible to set a PQI threshold in such a way that, if PQI is below the threshold, the packet demodulation is automatically aborted.
- **SQI**: It is possible to set a SQI threshold in such a way that, if SQI is below the threshold, the packet demodulation is automatically aborted. When the SQI threshold is set at 0, a perfect match is required. It is recommended to always enable the SQI check.

## 7.8 Data coding and integrity check

### 7.8.1 FEC

The device provides hardware support for error correction and detection.

Error correction can be either enabled or disabled according to link reliability and power consumption needs.

Convolution coding (rate 1/2) and interleaving (FEC) can optionally be applied to the data. FEC can be enabled by setting the FEC_EN register. When FEC is enabled the number of transmitted bits is roughly doubled hence the on-air packet duration in time is roughly double as well. The data rate specified in section always applies to the on-air transmitted data.

FEC is applied to all the fields of BASIC and STack packet format, except Preamble, Sync and Postamble. While is applied to all the fields except Preamble and Sync for the 802.15.4g packet format.

For the 802.15.4g packet format, two different coding schemes can be selected depending on the setting of the FEC_TYPE_4G register. In particular if FEC_TYPE_4G = 0 then the NRNSC encoder is selected, otherwise the RSC one is selected. Please note that the NRNSC encoder for 802.15.4g is the same as the one used in Basic and STack formats with logical inversion of the output symbols.

When FEC is enabled then the transmitter automatically selects the secondary SYNC word. On receiver side, a FEC coded frame is recognized by the reception of such secondary SYNC word and FEC is automatically activated independently of the setting of the FEC_EN register.

Use of FEC coding is exclusive with Manchester and Three-out-of-six coding.

#### *7.8.1.1 Interleaving*

In order to improve the effectiveness of convolutional encoding, matrix interleaving is applied to the encoded data at the output of the convolutional encoder.

The symbols from the output of the encoder are written raw-wise into a 4x4 matrix buffer starting from the upper-left cell and read column-wise starting from the lower-right cell.

Each pair of encoded symbols corresponding to one single encoded bit is packet into a single matrix cell. For each encoded symbols pair $s_0(n)$ is transmitted first on air, $s_1(n)$ is transmitted second.

Note that interleaving is always enabled together with FEC for the Basic and STack packet formats while it can be optionally enabled in the case of the 802.15.4g packet format by setting to '1' the INT_EN_4G register.

### 7.8.2 Manchester coding

Manchester coding can be enabled for the Basic and STack packet formats only by setting to '1' the MANCHESTER_EN register.

Manchester coding is not compatible with FEC and Three-out-of-six coding.

When Manchester coding is enabled each bit '1' is actually transmitted on air as a '10' sequence while a bit '0' is transmitted as a '01' sequence. If enabled, Manchester encoding is applied to all bits following the SYNC word.

### 7.8.3 3-out-of-6 coding

The 3-out-of-6 coding is a form of block coding that can be enabled for the Basic packet format for compatibility with the MBUS standard setting to '1' the MBUS_3OF6_EN bit of PCKTCTRL2. This coding is not expected to be used in other packet formats and is exclusive with FEC and Manchester coding.

Coding is done according to the table below.

**Table 57. 3-out-of-6 coding scheme**

| NRZ code | NRZ-decimal | 6-bit code | 6-bit decimal | N. of transitions |
|---|---|---|---|---|
| 0000 | 0 | 010110 | 22 | 4 |
| 0001 | 1 | 001101 | 13 | 3 |
| 0010 | 2 | 001110 | 14 | 2 |
| 0011 | 3 | 001011 | 11 | 3 |
| 0100 | 4 | 011100 | 28 | 2 |
| 0101 | 5 | 011001 | 25 | 3 |
| 0110 | 6 | 011010 | 26 | 4 |
| 1000 | 8 | 101100 | 44 | 3 |
| 1001 | 9 | 100101 | 37 | 4 |
| 1010 | 10 | 100110 | 38 | 3 |
| 1011 | 11 | 100011 | 35 | 2 |
| 1100 | 12 | 110100 | 52 | 3 |
| 1101 | 13 | 110001 | 49 | 2 |
| 1110 | 14 | 110010 | 50 | 3 |
| 1111 | 15 | 101001 | 41 | 4 |

## 7.9 CRC

Error detection is implemented by means of cyclic redundancy check codes. The CRC is calculated over all fields excluding preamble and SYNC word. The length of the checksum is programmable to 8, 16, 24 or 32 bits. The following standard CRC polynomials can be selected:

- mode 1: 8 bits: the poly is (0x07) $X^8+X^2+X+1$
- mode 2: 16 bits: the poly is (0x8005) $X^{16}+X^{15}+X^2+1$
- mode 3: 16 bits: the poly is (0x1021) $X^{16}+X^{12}+X^5+1$
- mode 4: 24 bits: the poly is (0x864CFB) $X^{24}+X^{23}+X^{18}+X^{17}+X^{14}+X^{11}+X^{10}+X^7+X^6+X^5+X^4+X^3+X+1$
- mode 5: 32 bits the poly is (0x4C11DB7 ) $x^{32}+x^{26}+ x^{23}+ x^{22}+ x^{16}+ x^{12}+ x^{11}+ x^{10}+ x^8+ x^7+ x^5+ x^4+ x^2+x+1$. 802.15.4g compatible

The initial state of the CRC polynomial is state to all 1b in all cases.

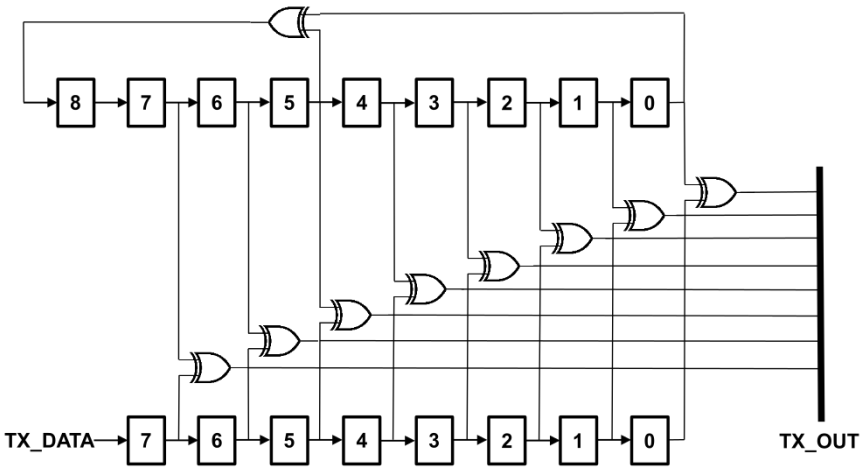
## 7.10 Data whitening

To prevent short repeating sequences (e.g., runs of 0's or 1's) that create spectral lines, which may complicate symbol tracking at the receiver or interfere with other transmissions, the device implements a data whitening feature. Data whitening is implemented with a maximum length LFSR generating a pseudo-random binary sequence used to XOR data before entering the encoding chain. The length of the LSFR is set to 9 bits.
The pseudo-random sequence is initialized to all 1's. When enabled through WHIT_EN register, the data are scrambled before being transmitted in such a way that long sequences of zeros or ones become very unlikely and physical layer algorithms perform better.

At the receiver end, the data are XOR-end with the same pseudo-random sequence. Whitening is applied according to the following LFSR implementation. Data whitening is always recommended.

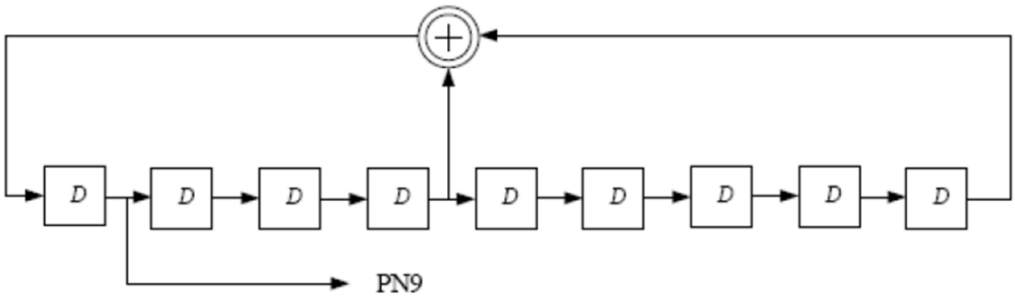
Data whitening is applied on all fields excluding the preamble, the SYNC words and the postamble for BASIC and STack packet format according to the following scheme:

**Figure 13. Data whitening scheme**



In the case of 802.15.4g packet format, on the receiver side, the use of whitening is signaled for each packet by one specific bit of the received PHR hence the WHIT_EN value is only used on the transmitter side. According to the standard, if enabled, whitening is applied to all fields following the PHR field, and is performed according to the following block diagram:

**Figure 14. Data whitening scheme 802.15.4g**



# 8 Link layer protocol

## 8.1 Automatic acknowledgment

The automatic acknowledgment embedded in the S2-LP allows the receiver to send back to the transmitter an ACK packet to confirm the reception of a packet. The automatic acknowledgement must be configured in receiver side by setting the register AUTO_ACK = 1b.

In transmitter side, the ACK request must be set according the NACK field of the packet: when the register NACK = 0b the NO_ACK field is ‘0’ that represents an ACK request.

Once the transmitter has sent a packet with an ACK request, it will wait for the ACK packet using the usual RX configuration: so the RX timer must be set according to the data rate, as well the receiver channel filter bandwidth and SQI. If the transmitter does not receive any ACK packet when it must, the packet transmitted is considered lost, and there is no TX_DATA_SENT IRQ notification.

The ACK packet sent is formatted as follows:

- The destination address field shall be set equal to the source address field of the received packet.
- The source address field shall be filled with content of register TX_SOURCE_ADDR.
- The sequence number of the ACK packet will be the same as the received packet.
- The control field shall be set accordingly to any pre-negotiated configuration.
- The main controller shall check if the PIGGYBACKING bit flag is set:
  - If it is set, it checks if there is any data in the TX FIFO: if found, it is transmitted in the payload field
- If any of the above checks fail, no payload is transmitted: an empty packet is sent which contains only the source and destination addresses and the sequence number of the packet being acknowledged. Anyway, the TX FIFO is read at list once, consequently generating an underflow condition in case of empty FIFO. To clear the FIFO, a FLUSHTXFIFO command is needed.
- The NO_ACK flag shall be set to either to ‘1’ (no explicit acknowledgment).

*Note: An ACK packet is considered received (there is no explicit way to signal that a packet is an ACK packet or not. If, after having sent a packet requiring acknowledgement, the transmitter receives a packet from the receiver with the same sequence number, it shall assume that this is an ACK packet.) if and only if it is not discarded for RX timeout, or filtered and its sequence number match that of the sent packet.*

If the automatic acknowledgment is enabled (receiver side), the TX command is not supported and must not be used.

In case of packet with fixed payload length, since the ‘empty packet’ does not contain any payload (as PIGGYBACKING bit is not set), the receiver could not be able to de-frame the packet. So the packet option having fixed payload length but no piggybacking is not supported by S2-LP.

The S2-LP device cannot operate at the same time in auto-acknowledge and auto-Re-TX modes (one at a time only).

The automatic acknowledgement is supported for STack packet format only.

The TX device is not able to receive any packets if the CSMA_ON bit is set to 1 (the RX operation works only for carrier sensing). To be able to receive the ACK packet, the CSMA_ON bit is set to 0b before switching to RX state.

### 8.1.1 Automatic acknowledgment with piggybacking

The receiver can fill the ACK packet with data. The mode piggybacking must be set and the TX FIFO must be filled with the payload to transmit.

When the transmitter uses the piggybacking to fill the ACK packet, a further automatic acknowledgment and/or retransmission are not explicitly supported. The transmitter, can determine if its piggybacked packet was received or not by the fact that the initiator will retransmit the original packet or not. Simply stated:

- If the receiver does not retransmit its packet, it means that he has correctly received the acknowledgment, hence the piggybacked packet, so everything is fine.
- If the initiator retransmits its packet, then the destination shall re-acknowledge it and just resend the piggyback packet again.

### 8.1.2 Automatic retransmission

If the transmitter does not receive the requested ACK packet, it can be configured to do other transmissions. The maximum number of transmission configurable is 16 and it is specified in the register NMAX_RETX (allowed value are from 0 to 15, setting it to '0' disables the feature). The current number of TX attempts is readable in the N_RETX register. At the end of the automatic retransmission procedure, the register N_RETX contains the effective number of attempts done (NMAX_RETX + 1 at most, in this case the interrupt "Max Re-TX reached" is generated and the TX FIFO is not cleared, MCU decides whether to flush the TX FIFO or not).

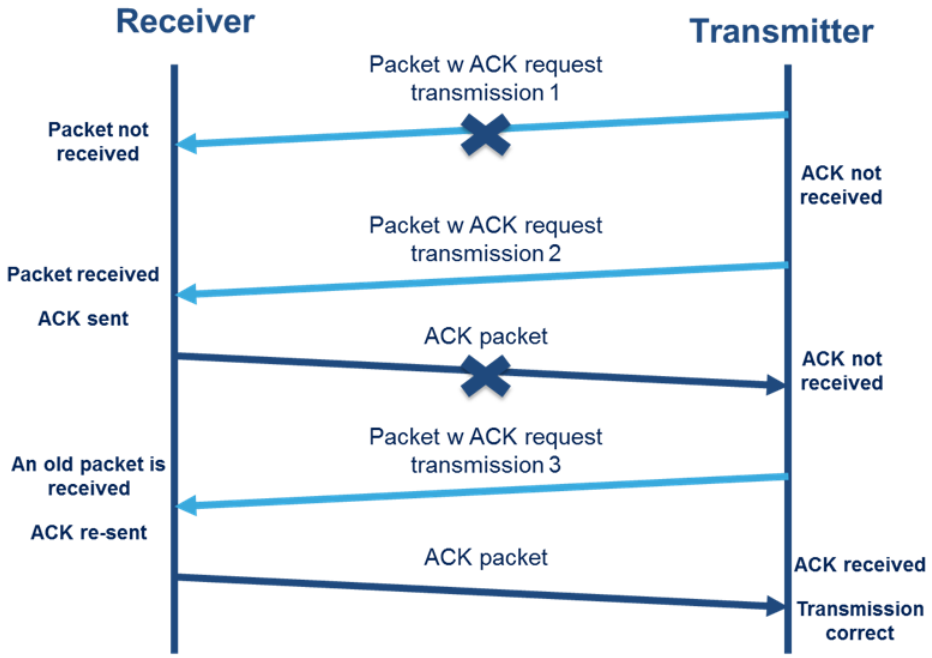
The TX FIFO does not need to be filled again for the retransmission, but must be loaded with a single write FIFO operation.

If the automatic retransmission is enabled (transmitter side), the RX command is not supported and must not be used.

In Figure 15. Automatic retransmission scenario a possible scenario is shown:

1. The receiver does not fulfill the ack request of the first transmission because does not receive the packet.
2. The transmitter send again the packet, but in this case is the ack packet to be lost. So, the communication fails again.
3. The transmitter send again the packet and receive the ack packet. The communication is working correctly this time.

**Figure 15. Automatic retransmission scenario**



## 8.2 Timeout protocol engine

The S2-LP provides programmable timers to reach the lowest low power consumption while at the same time keeping an efficient communication link.

**Table 58. Timer description and duration (the values are related to $f_{dig}$ of 26 MHz)**

| Timer name | Description | $f_{source}$ | Time step [µs] | Max. time | Formula |
|---|---|---|---|---|---|
| RX timer | Once is expired the reception ends | $\frac{f_{dig}}{1210}$ | ~46 | ~3s | $\frac{1}{f\text{source}}*((PRESCALER+1)*COUNTER-1)$ PRESCALER : register 0x47 |

| Timer name | Description | $f_{source}$ | Time step [µs] | Max. time | Formula |
|---|---|---|---|---|---|
| | | | | | COUNTER: register 0x46 |
| LDC timer (1) | Set the wake-up period during LDC operations | $frco, \frac{Frco}{2}, \frac{Frco}{4}, \frac{Frco}{8}$ | ~29<br>~58<br>~116<br>~232 | ~2s<br>~4s<br>~8s<br>~16s | $\frac{1}{f\mathbf{source}} * (PRESCALER + 1) * \left(COUNTER + 1\right)$<br>PRESCALER : register 0x48, 0x4A<br>COUNTER: register 0x49, 0x4B |
| Sniff timer | RSSI settling time before valid carrier sense | $\frac{F_{dig}}{24\ 2^{CHFLT\_E}}$ | 1 µs - 473 µs | 235 µs - 120 ms | $\frac{1}{f\mathbf{source}} * FAST\_RX\_TIMER$ FAST_RX_TIMER : register 0x54 |

1. *The LDC timer can be scaled by 1, 2, 4 or 8.*

### 8.2.1 Low duty cycle mode

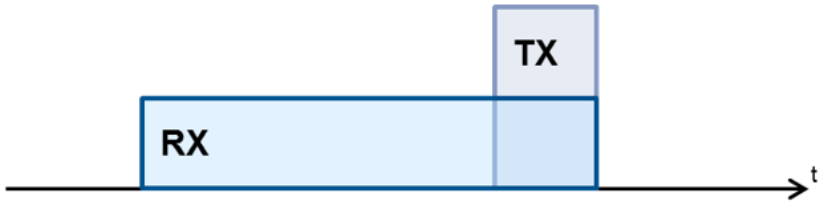
The S2-LP provides an embedded low duty cycle mode (LDC), that allows reducing the average power consumption during receive operations and to build a synchronized start network where both transmitter and receiver can go in low power mode periodically to reduce average power consumption.

The LDC mode is controlled essentially by the LDC timer, which periodically wakes up the S2-LP to perform a transmission or a reception.

In reception mode, it is also relevant to set up the RX timer in order to minimize the amount of time the S2-LP waits for a packet. The RX timer defines the RX windows within a valid SYNC word should be detected.

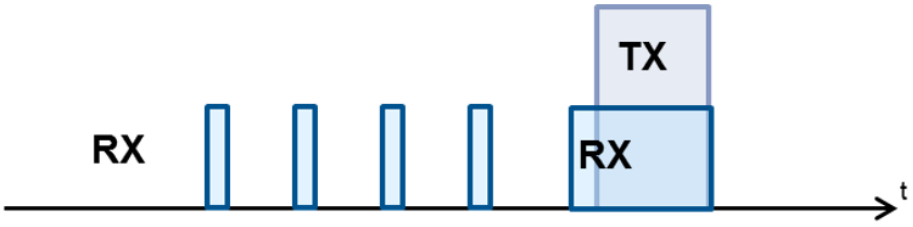
As shown in Figure 16. Common RX operation, a common receiver usually stays in RX state for long time waiting of the TX packet.

**Figure 16. Common RX operation**



Using the LDC mode, the S2-LP wakes up periodically saving a lot of power.

**Figure 17. LDC RX operation**



If synchronization between transmitter and receiver is required, a programmable timer value can be reloaded at SYNC word detection by the receiver or by SPI command.

The timer used to wait for the wakeup ($T_{WU}$) is clocked by the signal generated by the RCO circuit (or by an external clock from a GPIO pin), and is programmable with the registers LDC_PRESCALER and LDC_COUNTER. The internal RC oscillator used by the LDC timer must be calibrated just before the LDC mode is used.

After the wake-up signaling from its internal timer, the S2-LP switches to RX (TX) state and an interrupt request is issued (if enabled and not masked). In order to allow for analog circuits settling, an idle time $T_{IDLE}$ should be allowed before effective operation: the effective reception starting time is related to the synchronization with the sender. The idle time could result longer than the minimum required to get RX circuits settling, and this cause power wasting. In order to minimize the TIDLE, S2-LP supports the runtime phasing of the internal wake-up timer, as follows:

- For both RX and TX devices, the value of the wake-up timer can be reloaded during runtime using the LDC_RELOAD command with the values written in the LDC_RELOAD_PRESCALER and LDC_COUNTER registers. In so doing, the counting can be delayed or anticipated.
- Only for the RX device, the wake-up timer can be automatically reloaded at the time the SYNC is received. This option must be enabled on the PROTOCOL register.

The estimation of the values to be reloaded in order to get optimal LDC phasing is in charge of the MCU, which should be synchronized with the S2-LP RCO using any of the available clock outputs.

The details about LDC operation for the RX device are the following:

1. The starting state is READY: as soon as user sets the LDC_MODE bit, LDC counter starts in free running mode.
2. The first RX operation is triggered by the RX command.
3. First RX should be executed with a long (or infinite) timeout (LDC counter is still free running, not synchronized).
4. After first RX, the user should synchronize the LDC counter by using the LDC_RELOAD command.
5. Synchronization could be automatically triggered by the detection of the SYNC word.
6. After each RX, the state machine runs as follows:
   a. If no pending interrupt (nIRQ=1), then automatically go to SLEEP for LDC, but only after RCCAL_OK goes to 1 (RCO calibration complete).
   b. If any pending interrupt (nIRQ=0), then stay in WAIT_SLEEP (MCU sends a SLEEP command to go to SLEEP and resume LDC operation).
7. If FIFOs are not retained in SLEEP, then the MCU must read the RX FIFO during the READY state, before giving the SLEEP command.
8. When the LDC_MODE bit is reset, the LDC counters continues decrementing and
   a. If the LDC_MODE bit is cleared during SLEEP mode, then the LDC timer does not wakes up the device any longer. A READY command is needed from MCU.
   b. If the LDC_MODE bit is cleared during the RX operation (so when still in active mode), then the device enters READY state at the end of the RX.

The details about LDC operation for the TX device are the following:

1. The starting state is READY: as soon as user sets the LDC_MODE bit, LDC counter starts in free running mode.
2. The first TX operation is triggered by the TX command.
3. First TX is executed always (even if TX FIFO is empty); the next happens only if TX FIFO is not empty.
4. At first TX, the LDC counter automatically is reloaded.
5. If TX FIFO is empty, the current slot is skipped and the device remains in SLEEP state.
6. The TX FIFO can be written during the SLEEP state also.
7. When the LDC_MODE bit is reset, the LDC counter continues decrementing and
   a. If the LDC_MODE bit is cleared during SLEEP mode, then the LDC timer does not wakes up the device any longer. A READY command is needed from MCU.
   b. If the LDC_MODE bit is cleared during the TX operation (so when still in active mode), then the device enters READY state at the end of the TX.

   However, it is also true that:
   a. In case the TX FIFO is empty, the device still remains in SLEEP state until the FIFO is written or a READY command is provided.
   b. In case the TX FIFO is not empty, a last TX operation is performed before the LDC stops.

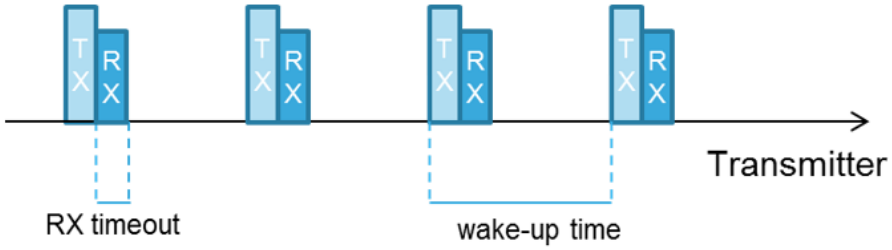
For the TX, the bit SLEEP_MODE_SEL should be set to 1, selecting the SLEEP_B mode. In this way, the TX_FIFO can be written in SLEEP.

#### 8.2.1.1 *Automatic acknowledgment*

The LDC mode can be used together with the automatic acknowledgment. In this case during a single LDC cycle both the operations of reception and transmission are performed.

In case of TX, the device wakes up every WAKE-UP time and switches to RX for the RX_TIMEOUT set waiting for an ack.

**Figure 18. LDC in TX with auto-ack**

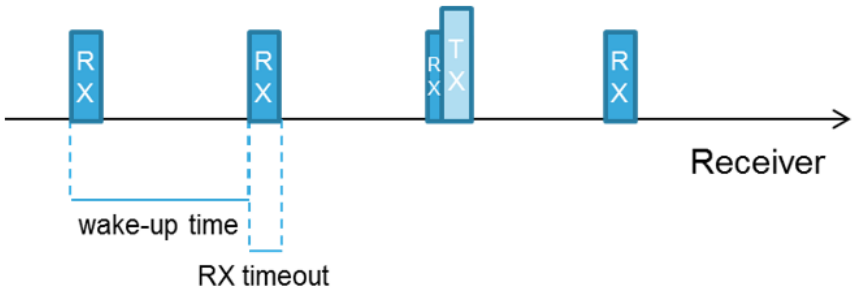


On each wake-up slot, the S2-LP enters TX only if the TX-FIFO is not empty, otherwise the TX slot is skipped with the device remaining in SLEEP.

In this case, the TX-FIFO must be retained during the SLEEP state, thus, the SLEEP_B must be selected setting the SLEEP_MODE_SEL bit to 1.

In case of RX the device enters RX and waits for a packet, if it is received, an ack is immediately transmitted back.

**Figure 19. LDC in RX with auto-ack**



### 8.2.2 Sniff mode

The sniff timer can be enabled, setting the register FAST_CS_TERM_EN, allowing sensing operation during periodic reception cycles. In this way, the receiver stays in RX for a time defined by the sniff timer (very short time). Once a valid carrier sense event is detected (carrier sense above a programmable RSSI threshold) the RX timer is enabled. Typical scenario is an asynchronous low duty cycle mode where the receiver has to “sniff” the carrier (the preamble sequence) and in case receive the packet. The sniff timer allows a very low duty cycle enabling an ultra-low power receive mode. The sniff timer frequency can be calculated according the following equation.

**Sniff timer equation**

$$f_{sniff} = \frac{f_{dig}}{\left(24 \cdot 2^{\Lambda}CHFLT\_E\right)} \quad (18)$$

This frequency is higher with a higher value of the channel filter exponent. The rationale behind this is that the RSSI settling time is as lower as higher is the channel filter bandwidth.

The expiration value of the sniff timer is programmed though the RSSI_SETTLING_LIMIT register. The timer is expected to be programmed to expire before PQI/SQI detection.

When the sniff timer is enabled, the main controlled monitors the settling of the RSSI. Once this is valid, the main controller checks for the CS valid signal:

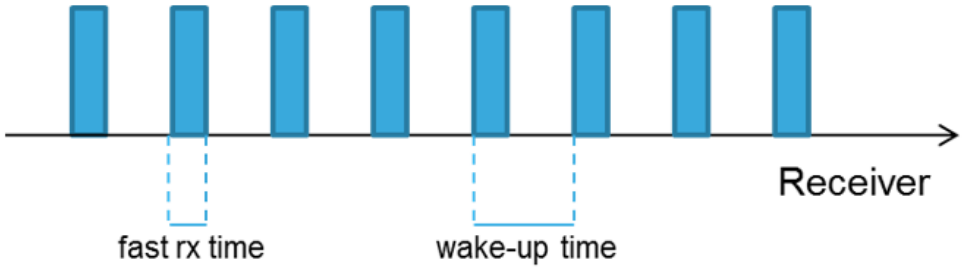
- If the CS valid is low, then the RX is aborted immediately.
- If the CS valid is high, then the RX continues and the main controller starts the CS/PQI/SQI timeout mechanism programmed.

The typical application scenario of the feature described above is the asynchronous LDC.

More specifically, if receiver and transmitter are not synchronized, then the receiver has to 'sniff' about the presence of a carrier during most of the wake-up time slot (inside the preamble transmission) and, in case of carrier level above the programmed threshold (CS valid), to wait for the SYNC word after the preamble.

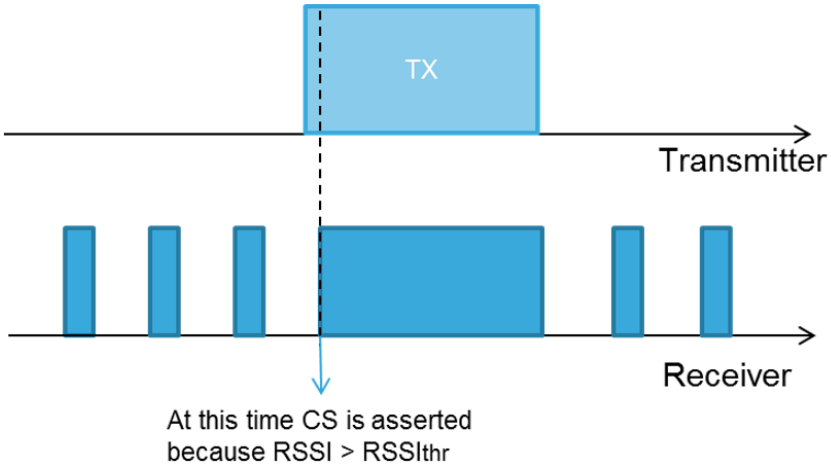
If the carrier is not present, the receiver should go back to sleep as soon as possible without waiting furthermore, in order to save on average current consumption.

**Figure 20. Fast RX termination mode with LDC**



If the carrier is present, it is possible to receive the entire frame because the RX timeout stop condition is switched to the normal mechanism of PQI/SQI and SYNC can be detected:

**Figure 21. Fast Rx termination: CS detection**



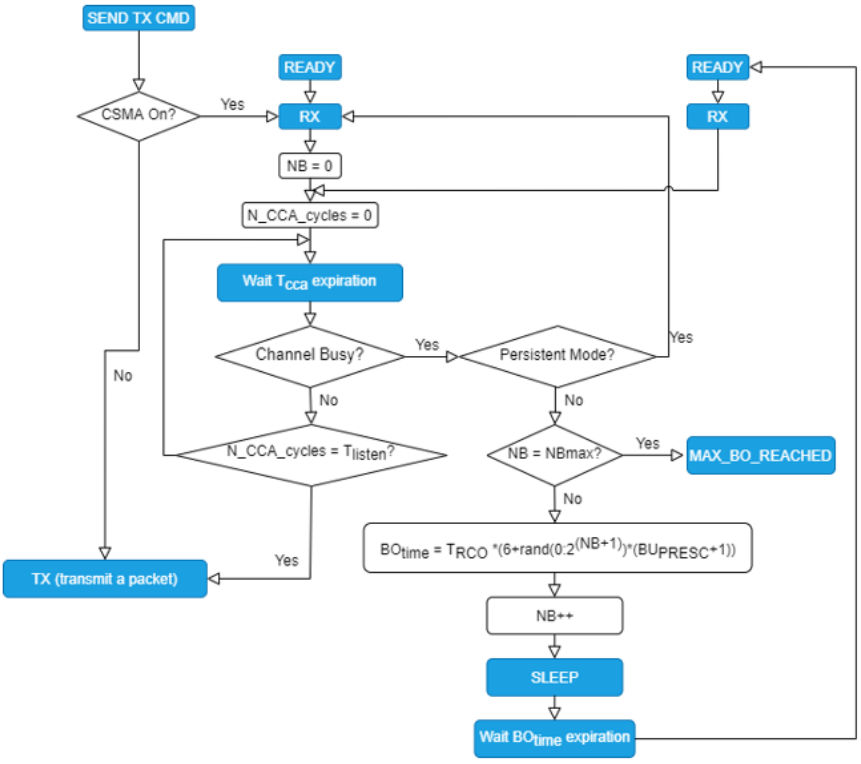
In order to ensure that TX frame is always captured, it is advisable to set wake-up time to less than the preamble time.

## 8.3 CSMA/CA engine

The CSMA/CA engine is a channel access mechanism based on the rule of sensing the channel before transmitting (listen before talk). This avoids the simultaneous use of the channel by different transmitters and increases the probability of correct reception of data being transmitted. This is done by a comparison of the RSSI sensed with the programmable threshold. If the channel is busy, a back-off procedure may be activated to repeat the process a certain number of times, until the channel is found to be idle. When the limit is reached, an interrupt notifies that the channel has been repeatedly found busy and so the transmission has not been performed. While in back-off, the S2-LP stays in SLEEP state in order to reduce power consumption. CCA may optionally be persistent continuing until the channel becomes idle or until the MCU stops it. The thinking behind using this option is to give the MCU the possibility of managing the CCA by itself, for instance, with the allocation of a transmission timer: this timer would start when MCU finishes sending out data to be transmitted, and would end when MCU expects that its transmission take place, which would occur after a period of CCA.

The overall CSMA/CA flowchart is shown in Figure 22. Flowchart of the S2-LP CSMA procedure, where $T_{cca}$ and $T_{listen}$ are two of the parameters controlling the clear channel assessment procedure. Design practice recommends that these parameters average the channel energy over a certain period expressed as a multiple of the bit period ($T_{cca}$) and repeat such measurement several times covering longer periods ($T_{listen}$). The measurement is performed directly by checking the carrier sense (CS) generated by the receiver module.

**Figure 22. Flowchart of the S2-LP CSMA procedure**



To avoid any wait synchronization between different channel contenders, which may cause successive failing CCA operations, the back-off wait time is calculated randomly inside a contention window. The back-off time BO is expressed as a multiple of back-off time units (BU). The contention window is calculated on the basis of the binary exponential back-off (BEB) technique, which doubles the size of the window at each back-off retry (stored in the NB counter):

$$BO_{time} = T_{RCO} * \left(6 + \text{rand}\left(0 : 2^{(NB+1)}\right) * (BU_{PRESC} + 1)\right) \quad (19)$$

During this time, the S2-LP is kept in the SLEEP state. If this CSMA mode is used, the user must set the SLEEP_MODE_SEL bit to 1 in order to guarantee the FIFO retention during the SLEEP phase.

The CSMA procedure is controlled by the following parameters:

**CSMA_ON**: enable/disable the CSMA procedure, this bit is checked at each packet transmission.

**CSMA_PERS_ON**: makes the carrier sense persistent that means the channel is continuously monitored until it becomes free again, skipping the back-off waiting steps. The MCU can stop the procedure with a SABORT command.

**CCA_PERIOD**: code that programs the $T_{cca}$ time (expressed as multiple of $T_{bit}$ samples) between two successive CS samplings, as follows:

- 00b: 64x$T_{bit}$
- 01b: 128x$T_{bit}$
- 10b: 256x$T_{bit}$
- 11b: 512x$T_{bit}$.

**NUM._OF_CCA_PERIOD**: configuration of $T_{listen}$ = [1..15] x $T_{cca}$.

**SEED_RELOAD**: enable/disable the reload of the seed used by the back-off random generator at the start of each CSMA procedure (at the time when the counter is reset, for example NB=0). If this functionality is not enabled, the seed is automatically generated and updated by the generator circuit itself.

**BU_COUNTER_SEED_MSByte/LSByte**: these bytes are used to set the seed of the pseudo-random number generator when the CSMA cycle starts, if the SEED_RELOAD bit is enabled. Value 0 is not allowed, because the pseudo-random generator is not working in that case.

**BU_PRESCALER**: PRESCALER which is used to configure the back-off time unit BU=BU_PRESCALER.

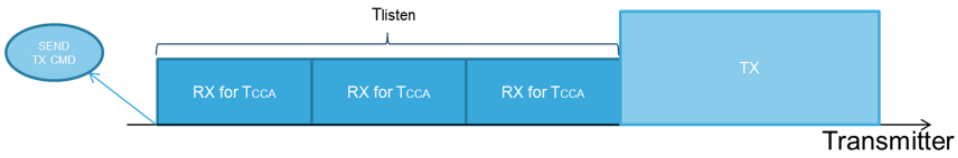
BU_PRESCALER value equal to 0 is not allowed.

**NBACKOFF_MAX**: max. number of back-off cycles.

Below the timelines of the main cases of transmission with CSMA.

If the channel is free, regardless the value of the persistent_mode bit, the device must assert channel free for a number of **NUM._OF_CCA_PERIOD** (T. listen) before transmitting:

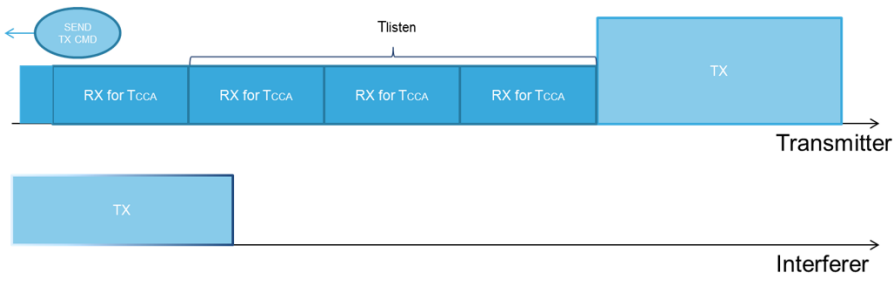
**Figure 23. CSMA if channel is free (timeline)**



If the channel is busy and persistent_mode bit is 1, the device checks the channel continuously in Tcca periods.

When the channel becomes free, it must assert channel free for a number of **NUM._OF_CCA_PERIOD** (T. listen) before transmitting:

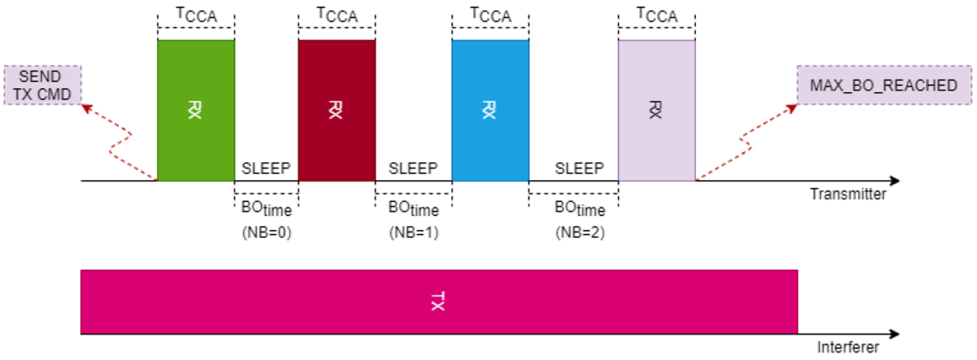
**Figure 24. CSMA with persistent mode if channel is busy (timeline)**



If the channel is busy and persistent_mode bit is 0, the device will check the channel for the Tcca period. At the end, being the CS (carrier sense) signal high, it will switch in SLEEP for a randomic time that can last $BO_{time} = T_{RCO}{}^{*}\left(6 + \text{rand}\left(0 : \ 2^{(NB+1)}\right)^{*}(BU_{PRESC} + 1)\right)$ with NB=0

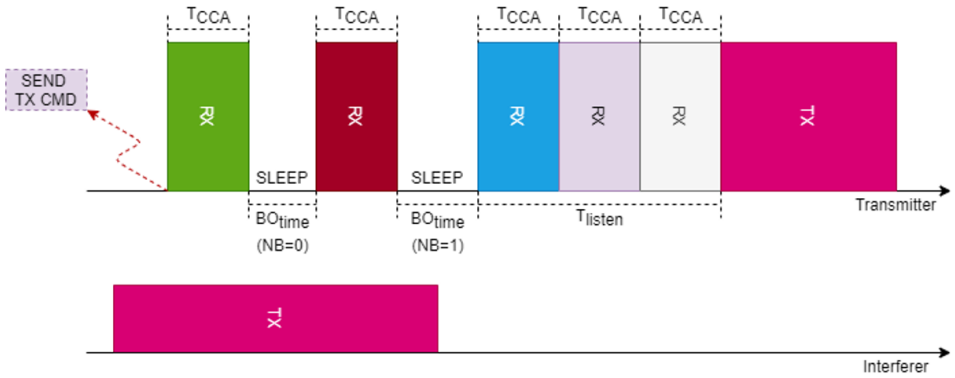
At the end of this period, it will again switch to RX for another Tcca, then sleep and so on until the number of back-off set is reached. At that point, an interrupt MAX_BO_REACHED is notified to the MCU:

**Figure 25. CSMA with non-persistent mode if channel is busy (timeline)**



Finally, if the channel becomes free (for example during one of the SLEEP times), the device must assert channel free for a number of **NUM._OF_CCA_PERIOD** (T. listen) before transmitting:

**Figure 26. CSMA with non-persistent mode if channel becomes free (timeline)**



*Note: in CSMA/CA mode it is not possible to go to RX state to receive packets: only carrier sensing is performed. To be able to receive an ACK packet it is necessary to deactivate the CSMA mode before switching to RX state.*

# 9 MCU interface

Communication with the MCU goes through a standard 4-wire SPI interface and 4 GPIOs (plus SHUTDOWN pin).

MCU can performs the following operations:

- Program the S2-LP in different operating modes by sending commands
- Read data from the RX FIFO and write data into the TX FIFO
- Configure the S2-LP through the registers
- Retrieve information from the S2-LP
- Get interrupt requests and signals from the GPIO pins
- Apply external signals to the GPIO pins
- Put the S2-LP in SHUTDOWN state or exit from SHUTDOWN state

## 9.1 Serial peripheral interface

The four-wire SPI interface consist of:

- **SCLK**: the SPI clock from MCU to the S2-LP
- **MOSI**: data from MCU to the S2-LP
- **MISO**: data from the S2-LP to MCU
- **CSn**: chip select signal, active low.

As the MCU is the master, it always drives the CSn and SCLK. According to the active SCLK polarity and phase, the S2-LP SPI can be classified as mode 0 (CPOL=0, CPHA=0), which means that the base value of SCLK is zero, data are read on the clock rising edge and data are changed on the clock falling edge. The MISO is in tri-state mode when CSn is high. All transfers are MSB first.

The interface allows the following operations:

- Write data (to registers or TX FIFO)
- Read data (from registers or RX FIFO)
- Send commands.

The SPI communication is supported in all the active states, and also during the low power state: STANDBY and SLEEP.

When accessing the SPI interface, the two status bytes of the MC_STATE (MC_STATE[1], MC_STATE[0]) registers are sent to the MISO pin.

**Figure 27. SPI write sequence**

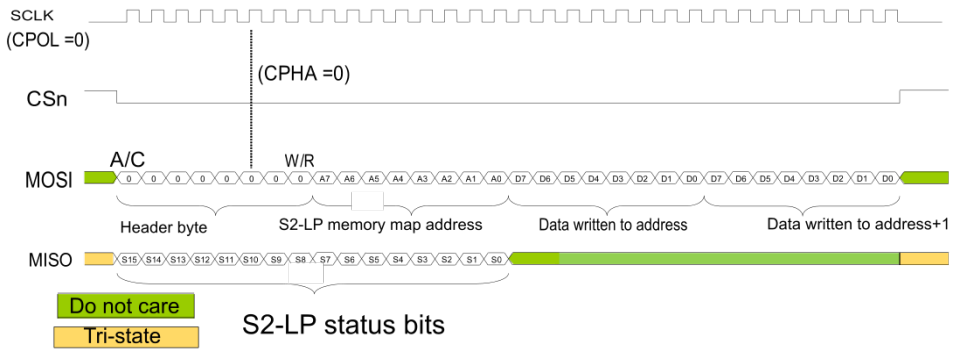


Figure 28. **SPI read sequence**

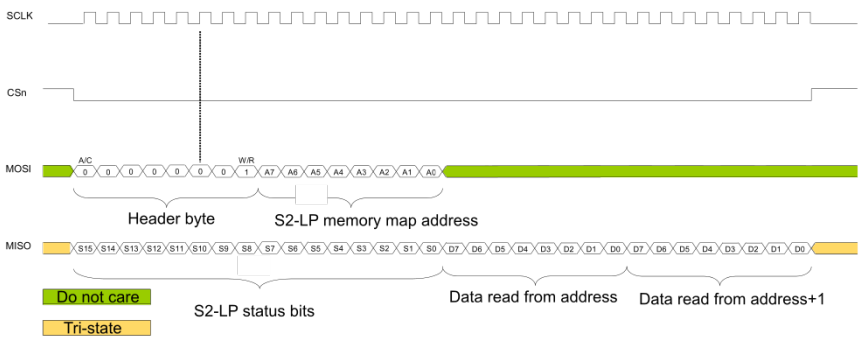

Figure 29. **SPI command sequence**

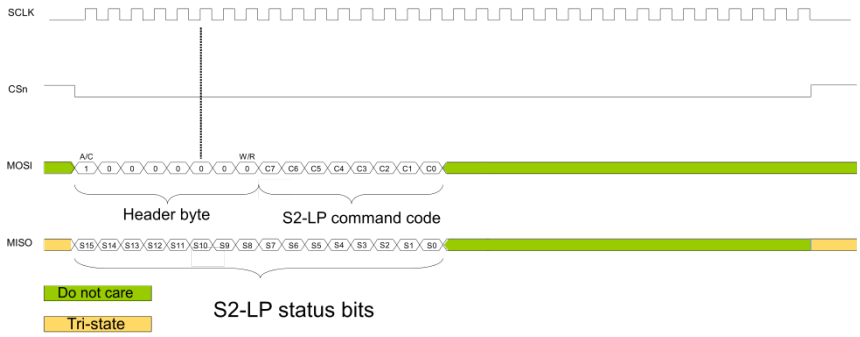

Concerning the first byte, the MSB is an A/C bit (address/commands: 0 indicates that the following byte is an address, 1 indicates that the following byte is a command code), while the LSB is a W/R bit (write/read: 1 indicates a read operation). All other bits must be zero.

Read and write operations are persistently executed while CSn is kept active (low), the address is automatically incremented (burst mode).

Accessing the FIFO is done as usual with the read and write commands, by putting, as address, the code 0xFF. Burst mode is available to access the sequence of bytes in the FIFO. Clearly, RX-FIFO is accessed with a read operation, TX-FIFO with a write operation.

## 9.2 Interrupts

In order to notify the MCU of a certain number of events an interrupt signal is generated on a selectable GPIO. The following events trigger an interrupt to the MCU:

Table 59. **Interrupts list**

| Bit | Events group | Interrupt event |
|---|---|---|
| 0 | Packet oriented | RX data ready |
| 1 | | RX data discarded (upon filtering) |
| 2 | | TX data sent |
| 3 | | Max. re-TX reached |
| 4 | | CRC error |
| 5 | | TX FIFO underflow/overflow error |
| 6 | | RX FIFO underflow/overflow error |

| Bit | Events group | Interrupt event |
|---|---|---|
| 7 | Packet oriented | TX FIFO almost full |
| 8 | | TX FIFO almost empty |
| 9 | | RX FIFO almost full |
| 10 | | RX FIFO almost empty |
| 11 | | Max. number of back-off during CCA |
| 12 | Signal quality related | Valid preamble detected |
| 13 | | Sync word detected |
| 14 | | RSSI above threshold (CS) |
| 15 | Device status related | Wake-up timeout in LDCR mode (1) |
| 16 | | READY (2) |
| 17 | | STANDBY state switching in progress |
| 18 | | Low battery level |
| 19 | | Power-on reset |
| 28 | Timer related | RX timer timeout |
| 29 | | Sniff timer timeout |

1. *The interrupt flag n.15 is set (and consequently the interrupt request) only when the XO clock is available for the state machine. This time may be delayed compared to the actual timer expiration. However, the real time event can be sensed putting the end-of-counting signal on a GPIO output.*
2. *The interrupt flag n.16 is set each time the S2-LP goes to READY state and the XO has completed its setting transient (XO ready condition detected).*

All interrupts are reported on a set of interrupt status registers and are individually maskable. The interrupt status register must be cleared upon a read event from the MCU.

The status of all the interrupts are reported in the IRQ_STATUS register: bits are high for the events that have generated any interrupts. The interrupts are individually maskable using the IRQ_MASK registers: if the mask bit related to a particular event is programmed at 0, that event does not generate any interrupt request.

**Table 60. IRQ type S2-LP state**

| IRQ Type | Status of S2-LP |
|---|---|
| IRQ_RX_DATA_READY | READY |
| IRQ_RX_DATA_DISC | READY |
| IRQ_TX_DATA_SENT | READY |
| IRQ_MAX_RE_TX_REACH | READY |
| IRQ_CRC_ERROR | READY |
| IRQ_TX_FIFO_ERROR | TX |
| IRQ_RX_FIFO_ERROR | READY |
| IRQ_TX_FIFO_ALMOST_FULL | READY |
| IRQ_TX_FIFO_ALMOST_EMPTY | TX |
| IRQ_RX_FIFO_ALMOST_FULL | READY |
| IRQ_RX_FIFO_ALMOST_EMPTY | READY |
| IRQ_MAX_BO_CCA_REACH | READY |
| IRQ_VALID_PREAMBLE | RX |
| IRQ_VALID_SYNC | RX |

| IRQ Type | Status of S2-LP |
|---|---|
| IRQ_RSSI_ABOVE_TH | RX |
| IRQ_WKUP_TOUT_LDC | READY/TX/RX |
| IRQ_READY | READY |
| IRQ_STANDBY_DELAYED | STANDBY |
| IRQ_LOW_BATT_LVL | ANY |
| IRQ_POR | READY |
| IRQ_BOR | ANY |
| IRQ_LOCK | READY |
| IRQ_VCO_CALIBRATION_END | READY |
| IRQ_PA_CALIBRATION_END | READY |
| IRQ_RX_TIMEOUT | READY |
| IRQ_RX_SNIFF_TIMEOUT | READY |

## 9.3 GPIOs

The four GPIOs can be configured as follows:

**Table 61. GPIO digital output functions**

| I/O selection | Output signal |
|---|---|
| 0 | nIRQ (interrupt request, active low) |
| 1 | POR inverted (active low) |
| 2 | Wake-up timer expiration: ‘1’ when WUT has expired |
| 3 | Low battery detection: ‘1’ when battery is below threshold setting |
| 4 | TX data internal clock output (TX data are sampled on the rising edge of it) |
| 5 | TX state outputs a command information coming from the RADIO_TX block |
| 6 | TX/RX FIFO almost empty flag |
| 7 | TX/RX FIFO almost full flag |
| 8 | RX data output |
| 9 | RX clock output (recovered from received data) |
| 10 | RX state indication: ‘1’ when the S2-LP is transiting in the RX state |
| 11 | Device in a state other than SLEEP or STANDBY: ‘0’ when in SLEEP/STANDBY |
| 12 | Device in STANDBY state |
| 13 | Antenna switch signal used for antenna diversity |
| 14 | Valid preamble detected flag |
| 15 | Sync word detected flag |
| 16 | RSSI above threshold (same indication of CS register) |
| 17 | Reserved |
| 18 | TX or RX mode indicator (to enable an external range extender) |
| 19 | VDD (to emulate an additional GPIO of the MCU, programmable by SPI) |
| 20 | GND (to emulate an additional GPIO of the MCU, programmable by SPI) |
| 21 | External SMPS enable signal (active high) |

| I/O selection | Output signal |
|---|---|
| 22 | Device in SLEEP state |
| 23 | Device in READY state |
| 24 | Device in LOCK state |
| 25 | Device waiting for a high level of the lock-detector output signal |
| 26 | TX_DATA_OOK signal (internal control signal generated in the OOK analog smooth mode) |
| 27 | Device waiting for a high level of the READY2 signal from XO |
| 28 | Device waiting for timer expiration to allow PM block settling |
| 29 | Device waiting for end of VCO calibration |
| 30 | Device enables the full circuitry of the SYNTH block |
| 31 | Reserved |

**Table 62. GPIO digital input functions**

| I/O selection | Input signal |
|---|---|
| 0 | 1 >> TX command |
| 1 | 1 >> RX command |
| 2 | TX data input for direct modulation |
| 3 | Wake-up from external input (sensor output) |
| 4 | External clock @ 34.7 kHz (used for LDC modes timing) |
| From 5 to 31 | Not used |

# 10 Register contents

Table 63. **Register contents**

| Name | Addr | Default | Bit | Field name | Description |
|---|---|---|---|---|---|
| **GPIO0_CONF** | 00 | 0A | 7:3 | GPIO_SELECT | Specify the GPIO0 I/O signal, default setting POR (see Table 61. GPIO digital output functions). |
| | | | 2 | RESERVED | - |
| | | | 1:0 | GPIO_MODE | GPIO0 Mode:<br>• 00b: Analog (Hi-Z)<br>• 01b: Digital input<br>• 10b: Digital output low power<br>• 11b: Digital output high power |
| **GPIO1_CONF** | 01 | A2 | 7:3 | GPIO_SELECT | Specify the GPIO1 I/O signal, default setting digital GND (see Table 61. GPIO digital output functions). |
| | | | 2 | RESERVED | - |
| | | | 1:0 | GPIO_MODE | GPIO1 mode:<br>• 00b: Analog (Hi-Z)<br>• 01b: Digital input1<br>• 10b: Digital output low power<br>• 11b: Digital Output High Power |
| **GPIO2_CONF** | 02 | A2 | 7:3 | GPIO_SELECT | Specify the GPIO2 I/O signal, default setting digital GND (see Table 61. GPIO digital output functions). |
| | | | 2 | RESERVED | - |
| | | | 1:0 | GPIO_MODE | GPIO2 mode:<br>• 00b: Analog (Hi-Z)<br>• 01b: Digital input<br>• 10b: Digital output low power<br>• 11b: Digital output high power |
| **GPIO3_CONF** | 03 | A2 | 7:3 | GPIO_SELECT | Specify the GPIO3 I/O signal, default setting digital GND (see Table 61. GPIO digital output functions). |
| | | | 2 | RESERVED | - |
| | | | 1:0 | GPIO_MODE | GPIO3 mode:<br>• 00b: Analog (Hi-Z)<br>• 00b: Analog<br>• 01b: Digital Input<br>• 10b: Digital Output Low Power<br>• 11b: Digital Output High Power |
| **SYNT3** | 05 | 42 | 7:5 | PLL_CP_ISEL | Set the charge pump current according to the XTAL frequency (see Table 37. Charge pump words). |
| | | | 4 | BS | Synthesizer band select. This parameter selects the out-of loop divide factor of the synthesizer:<br>• 0: 4, band select factor for high band<br>• 1: 8, band select factor for middle band (see Section 5.3.1 RF channel frequency settings). |
| | | | 3:0 | SYNT[27:24] | MSB bits of the PLL programmable divider (see Section 5.3.1 RF channel frequency settings). |
| **SYNT2** | 06 | 16 | 7:0 | SYNT[23:16] | Intermediate bits of the PLL programmable divider (see Section 5.3.1 RF channel frequency settings). |

| Name | Addr | Default | Bit | Field name | Description |
|---|---|---|---|---|---|
| **SYNT1** | 07 | 27 | 7:0 | SYNT[15:8] | Intermediate bits of the PLL programmable divider (see Section 5.3.1 RF channel frequency settings). |
| **SYNT0** | 08 | 62 | 7:0 | SYNT[7:0] | LSB bits of the PLL programmable divider (see Section 5.3.1 RF channel frequency settings). |
| **IF_OFFSET_ANA** | 09 | 2A | 7:0 | IF_OFFSET_ANA | Intermediate frequency setting for the analog RF synthesizer, default: 300 kHz, see Eq. (15). |
| **IF_OFFSET_DIG** | 0A | B8 | 7:0 | IF_OFFSET_DIG | Intermediate frequency setting for the digital shift-to-baseband circuits, default: 300 kHz, see Eq. (15). |
| **CHSPACE** | 0C | 3F | 7:0 | CH_SPACE | Channel spacing setting, see Eq. (16). |
| **CHNUM** | 0D | 00 | 7:0 | CH_NUM | Channel number. This value is multiplied by the channel spacing and added to the synthesizer base frequency to generate the actual RF carrier frequency, see Eq. (16). |
| **MOD4** | 0E | 83 | 7:0 | DATARATE_M[15:8] | The MSB of the mantissa value of the data rate equation, see Eq. (14). |
| **MOD3** | 0F | 2B | 7:0 | DATARATE_M[7:0] | The LSB of the mantissa value of the data rate equation, see Eq. (14). |
| **MOD2** | 10 | 77 | 7:4 | MOD_TYPE | Modulation type:<br>• 0: 2-FSK<br>• 1: 4-FSK<br>• 2: 2-GFSK BT=1<br>• 3: 4-GFSK BT=1<br>• 5: ASK/OOK<br>• 7: unmodulated<br>• 10: 2-GFSK BT=0.5<br>• 11: 4-GFSK BT=0.5 |
| | | | 3:0 | DATARATE_E | The exponent value of the data rate equation (see Eq. (14) ). |
| **MOD1** | 11 | 03 | 7 | PA_INTERP_EN | 1: enable the PA power interpolator (see Section 5.6.1 PA configuration). |
| | | | 6 | MOD_INTERP_EN | 1: enable frequency interpolator for the GFSK shaping (see Section 5.4.1.1 Gaussian shaping). |
| | | | 5:4 | CONST_MAP | Select the constellation map for 4-(G)FSK or 2-(G)FSK modulations (see Table 41. Constellation mapping 2-(G)FSK and Table 42. Constellation mapping 4-(G)FSK). |
| | | | 3:0 | FDEV_E | The exponent value of the frequency deviation equation (see Eq. (10)). |
| **MOD0** | 12 | 93 | 7:0 | FDEV_M | The mantissa value of the frequency deviation equation (see Eq. (10)). |
| **CHFLT** | 13 | 23 | 7:4 | CHFLT_M | The mantissa value of the receiver channel filter (see Table 44. Channel filter words). |
| | | | 3:0 | CHFLT_E | The exponent value of the receiver channel filter (see Table 44. Channel filter words). |
| **AFC2** | 14 | C8 | 7 | AFC_FREEZE_ON_SYNC | 1: enable the freeze AFC correction upon sync word detection. |
| | | | 6 | AFC_ENABLED | 1: enable the AFC correction. |
| | | | 5 | AFC_MODE | Select AFC mode:<br>0: AFC loop closed on slicer<br>1: AFC loop closed on second conversion stage. |
| | | | 4:0 | RESERVED | - |
| **AFC1** | 15 | 18 | 7:0 | AFC_FAST_PERIOD | The length of the AFC fast period. |
| **AFC0** | 16 | 25 | 7:4 | AFC_FAST_GAIN | The AFC loop gain in fast mode (2's log). |

| Name | Addr | Default | Bit | Field name | Description |
|---|---|---|---|---|---|
| **AFC0** | 16 | 25 | 3:0 | AFC_SLOW_GAIN | The AFC loop gain in slow mode (2's log). |
| **RSSI_FLT** | 17 | E3 | 7:4 | RSSI_FLT | Gain of the RSSI filter. |
| | | | 3:2 | CS_MODE | Carrier sense mode:<br>• 00b: Static CS<br>• 01b: Dynamic CS with 6dB dynamic threshold<br>• 10b: Dynamic CS with 12dB dynamic threshold<br>• 11b: Dynamic CS with 18dB dynamic threshold.<br>(see Section 5.5.8.2 Carrier sense) |
| | | | 1:0 | RESERVED | - |
| **RSSI_TH** | 18 | 28 | 7:0 | RSSI_TH | Signal detect threshold in 1 dB steps. The RSSI_TH can be converted in dBm using the formula RSSI_TH-146. |
| **AGCCTRL4** | 1A | 54 | 7:4 | LOW_THRESHOLD_0 | Low threshold 0 for the AGC |
| | | | 3:0 | LOW_THRESHOLD_1 | Low threshold 1 for the AGC |
| **AGCCTRL3** | 1B | 10 | 7:0 | LOW_THRESHOLD_SEL | Low threshold selection (defined in the AGCCTRL4). Bitmask for each attenuation step. |
| **AGCCTRL2** | 1C | 22 | 7:6 | RESERVED | - |
| | | | 5 | FREEZE_ON_SYNC | Enable the AGC algorithm to be frozen on SYNC |
| | | | 4 | RESERVED | - |
| | | | 3:0 | MEAS_TIME | AGC measurement time |
| **AGCCTRL1** | 1D | 59 | 7:4 | HIGH_THRESHOLD | High threshold for the AGC |
| | | | 3:0 | RESERVED | - |
| **AGCCTRL0** | 1E | 8C | 7 | AGC_ENABLE | 0: disabled<br>1: enabled |
| | | | 6 | RESERVED | - |
| | | | 5:0 | HOLD_TIME | Hold time for after gain adjustment for the AGC. |
| **ANT_SELECT_CONF** | 1F | 45 | 7 | RESERVED | - |
| | | | 6:5 | EQU_CTRL | ISI cancellation equalizer:<br>• 00b: equalization disabled<br>• 01b: single pass equalization<br>• 10b: dual pass equalization.<br>(see Section 5.4.1.2 ISI cancellation 4-(G)FSK) |
| | | | 4 | CS_BLANKING | Do not fill the RX FIFO with data if the CS is threshold (see Section 5.5.9 CS blanking). |
| | | | 3 | AS_ENABLE | 1: enable the antenna switching (see Section 5.5.10 Antenna switching). |
| | | | 2:0 | AS_MEAS_TIME | Set the measurement time. |
| **CLOCKREC2** | 20 | C0 | 7:5 | CLK_REC_P_GAIN_SLOW | Clock recovery slow loop gain (log2). |
| | | | 4 | CLK_REC_ALGO_SEL | Select the symbol timing recovery algorithm:<br>• 0: DLL<br>• 1: PLL. |
| | | | 3:0 | CLK_REC_I_GAIN_SLOW | Set the integral slow gain for symbol timing recovery (PLL mode only). |
| **CLOCKREC1** | 21 | 58 | 7:5 | CLK_REC_P_GAIN_FAST | Clock recovery fast loop gain (log2). |
| | | | 4 | PSTFLT_LEN | Select the post filter length:<br>• 0: 8 symbols |

| Name | Addr | Default | Bit | Field name | Description |
|---|---|---|---|---|---|
| CLOCKREC1 | 21 | 58 | | | • 1: 16 symbols. |
| | | | 3:0 | CLK_REC_I_GAIN_FAST | Set the integral fast gain for symbol timing recovery (PLL mode only). |
| PCKTCTRL6 | 2B | 80 | 7:2 | SYNC_LEN | The number of bits used for the SYNC field in the packet. |
| | | | 1:0 | PREAMBLE_LEN[9:8] | The MSB of the number of '01 or '10' of the preamble of the packet. |
| PCKTCTRL5 | 2C | 10 | 7:0 | PREAMBLE_LEN[7:0] | The LSB of the number of '01 or '10' of the preamble of the packet. |
| PCKTCTRL4 | 2D | 00 | 7 | LEN_WID | The number of bytes used for the length field:<br>• 0: 1 byte<br>• 1: 2 bytes. |
| | | | 6:4 | RESERVED | - |
| | | | 3 | ADDRESS_LEN | 1: include the ADDRESS field in the packet. |
| | | | 2:0 | RESERVED | - |
| PCKTCTRL3 | 2E | 20 | 7:6 | PCKT_FRMT | Format of packet:<br>• 0: Basic<br>• 1: 802.15.4g<br>• 2: UART OTA<br>• 3: Stack<br>(see Section 7 Packet handler engine ) |
| | | | 5:4 | RX_MODE | RX mode:<br>• 0: normal mode<br>• 1: direct through FIFO<br>• 2: direct through GPIO |
| | | | 3 | FSK4_SYM_SWAP | Select the symbol mapping for 4(G)FSK. |
| | | | 2 | BYTE_SWAP | Select the transmission order between MSB and LSB. |
| | | | 1:0 | PREAMBLE_SEL | Select the preamble pattern. |
| PCKTCTRL2 | 2F | 00 | 7:6 | RESERVED | - |
| | | | 5 | FCS_TYPE_4G | This is the FCS type in header field of 802.15.4g packet. |
| | | | 4 | FEC_TYPE_4G/STOP_BIT | • If the 802.15.4 mode is enabled, this is the FCS type in header field of 802.15.4g packet. Select the FEC type of 802.15.4g packet:<br>– 0: NRNSC<br>– 1: RSC.<br>• If the UART packet is enabled, this is the value of the STOP_BIT. |
| | | | 3 | INT_EN_4G/START_BIT | • If the 802.15.4 mode is enabled, 1: enable the interleaving of 802.15.4g packet.<br>• If the UART packet is enabled, this is the value of the START_BIT. |
| | | | 2 | MBUS_3OF6_EN | 1: enable the 3-out-of-6 encoding/decoding. |
| | | | 1 | MANCHESTER_EN | 1: enable the Manchester encoding/decoding. |
| | | | 0 | FIX_VAR_LEN | Packet length mode:<br>• 0: fixed<br>• 1: variable (in variable mode the field LEN_WID of PCKTCTRL3 register must be configured) |
| PCKTCTRL1 | 30 | 2C | 7:5 | CRC_MODE | CRC field:<br>• 0: no CRC field<br>• 1: CRC using poly 0x07 |

| Name | Addr | Default | Bit | Field name | Description |
|---|---|---|---|---|---|
| **PCKTCTRL1** | 30 | 2C | | | • 2: CRC using poly 0x8005<br>• 3: CRC using poly 0x1021<br>• 4: CRC using poly 0x864CBF<br>• 5: CRC using poly |
| | | | 4 | WHIT_EN | 1: enable the whitening mode. |
| | | | 3:2 | TXSOURCE | Tx source data:<br>• 0: normal mode<br>• 1: direct through FIFO<br>• 2: direct through GPIO<br>• 3: PN9 |
| | | | 1 | SECOND_SYNC_SEL | In TX mode:<br>• 0 select the primary SYNC word<br>• 1 select the secondary SYNC word.<br>In RX mode, if 1 enable the dual SYNC word detection mode. |
| | | | 0 | FEC_EN | 1: enable the FEC encoding in TX or the Viterbi decoding in RX. |
| **PCKTLEN1** | 31 | 00 | 7:0 | PCKTLEN1 | MSB of length of packet in bytes. |
| **PCKTLEN0** | 32 | 14 | 7:0 | PCKTLEN0 | LSB of length of packet in bytes. |
| **SYNC3** | 33 | 88 | 7:0 | SYNC3 | SYNC word byte 3. |
| **SYNC2** | 34 | 88 | 7:0 | SYNC2 | SYNC word byte 2. |
| **SYNC1** | 35 | 88 | 7:0 | SYNC1 | SYNC word byte 1. |
| **SYNC0** | 36 | 88 | 7:0 | SYNC0 | SYNC word byte 0. |
| **QI** | 37 | 01 | 7:5 | SQI_TH | SQI threshold. |
| | | | 4:1 | PQI_TH | PQI threshold. |
| | | | 0 | SQI_EN | 1: enable the SQI check. |
| **PCKT_PSTMBL** | 38 | 00 | 7:0 | PCKT_PSTMBL | Set the packet postamble length. |
| **PROTOCOL2** | 39 | 40 | 7 | CS_TIMEOUT_MASK | 1: enable the CS value contributes to timeout disabling. |
| | | | 6 | SQI_TIMEOUT_MASK | 1: enable the SQI value contributes to timeout disabling. |
| | | | 5 | PQI_TIMEOUT_MASK | 1: enable the PQI value contributes to timeout disabling. |
| | | | 4:3 | TX_SEQ_NUM_RELOAD | TX sequence number to be used when counting reset is required using the related command. |
| | | | 2 | FIFO_GPIO_OUT_MUX_SEL | 0: select the almost empty/full control for TX FIFO.<br>1: select the almost empty/full control for RX FIFO. |
| | | | 1:0 | LDC_TIMER_MULT | Set the LDC timer multiplier factor:<br>• 00b: x1<br>• 01b: x2<br>• 10b: x4<br>• 11b: x8. |
| **PROTOCOL1** | 3A | 00 | 7 | LDC_MODE | 1: enable the Low Duty Cycle mode. |
| | | | 6 | LDC_RELOAD_ON_SYNC | 1: enable the LDC timer reload mode. |
| | | | 5 | PIGGYBACKING | 1: enable the piggybacking. |
| | | | 4 | FAST_CS_TERM_EN | 1: enable the RX sniff timer. |
| | | | 3 | SEED_RELOAD | 1: enable the reload of the back-off random generator seed using the value written in the BU_COUNTER_SEED. |
| | | | 2 | CSMA_ON | 1: enable the CSMA channel access mode. |
| | | | 1 | CSMA_PERS_ON | 1: enable the CSMA persistent mode (no back-off cycles). |

| Name | Addr | Default | Bit | Field name | Description |
|---|---|---|---|---|---|
| **PROTOCOL1** | 3A | 00 | 0 | AUTO_PCKT_FLT | 1: enable the automatic packet filtering control. |
| **PROTOCOL0** | 3B | 08 | 7:4 | NMAX_RETX | Max. number of re-TX (from 0 to 15)(0: re-transmission is not performed). |
| | | | 3 | NACK_TX | 1: field NO_ACK=1 on transmitted packet. |
| | | | 2 | AUTO_ACK | 1: enable the automatic acknowledgment if packet received request. |
| | | | 1 | PERS_RX | 1: enable the persistent RX mode. |
| | | | 0 | RESERVED | - |
| **FIFO_CONFIG3** | 3C | 30 | 7 | RESERVED | - |
| | | | 6:0 | RX_AFTHR | Set the RX FIFO almost full threshold. |
| **FIFO_CONFIG2** | 3D | 30 | 7 | RESERVED | - |
| | | | 6:0 | RX_AETHR | Set the RX FIFO almost empty threshold. |
| **FIFO_CONFIG1** | 3E | 30 | 7 | RESERVED | - |
| | | | 6:0 | TX_AFTHR | Set the TX FIFO almost full threshold. |
| **FIFO_CONFIG0** | 3F | 30 | 7 | RESERVED | - |
| | | | 6:0 | TX_AETHR | Set the TX FIFO almost empty threshold. |
| **PCKT_FLT_OPTIONS** | 40 | 40 | 7 | RESERVED | - |
| | | | 6 | RX_TIMEOUT_AND_OR_SEL | Logical Boolean function applied to CS/SQI/PQI values: 1: OR, 0: AND. |
| | | | 5 | RESERVED | - |
| | | | 4 | SOURCE_ADDR_FLT | 1: RX packet accepted if its source field matches with RX_SOURCE_ADDR register |
| | | | 3 | DEST_VS_BROADCAST_ADDR | 1: RX packet accepted if its source field matches with BROADCAST_ADDR register. |
| | | | 2 | DEST_VS_MULTICAST_ADDR | 1: RX packet accepted if its destination address matches with MULTICAST_ADDR register. |
| | | | 1 | DEST_VS_SOURCE_ADDR | 1: RX packet accepted if its destination address matches with RX_SOURCE_ADDR register. |
| | | | 0 | CRC_FLT | 1: packet discarded if CRC is not valid. |
| **PCKT_FLT_GOALS4** | 41 | 00 | 7:0 | RX_SOURCE_MASK | Mask register for source address filtering. |
| **PCKT_FLT_GOALS3** | 42 | 00 | 7:0 | RX_SOURCE_ADDR/ DUAL_SYNC3 | If dual sync mode enabled: dual SYNC word byte 3, Otherwise RX packet source or TX packet destination field. |
| **PCKT_FLT_GOALS2** | 43 | 00 | 7:0 | BROADCAST_ADDR/ DUAL_SYNC2 | If dual sync mode enabled: dual SYNC word byte 2, Broadcast address. |
| **PCKT_FLT_GOALS1** | 44 | 00 | 7:0 | MULTICAST_ADDR/ DUAL_SYNC1 | If dual sync mode enabled: dual SYNC word byte 1, Multicast address. |
| **PCKT_FLT_GOALS0** | 45 | 00 | 7:0 | TX_SOURCE_ADDR/ DUAL_SYNC0 | If dual sync mode enabled: dual SYNC word byte 0, Tx packet source or RX packet destination field. |
| **TIMERS5** | 46 | 01 | 7:0 | RX_TIMER_CNTR | Counter for RX timer. |
| **TIMERS4** | 47 | 00 | 7:0 | RX_TIMER_PRESC | Prescaler for RX timer. |
| **TIMERS3** | 48 | 01 | 7:0 | LDC_TIMER_PRESC | Prescaler for wake up timer. |
| **TIMERS2** | 49 | 00 | 7:0 | LDC_TIMER_CNTR | Counter for wake up timer. |
| **TIMERS1** | 4A | 01 | 7:0 | LDC_RELOAD_PRSC | Prescaler value for reload operation of wake up timer. |
| **TIMERS0** | 4B | 00 | 7:0 | LDC_RELOAD_CNTR | Counter value for reload operation of wake up timer. |

| Name | Addr | Default | Bit | Field name | Description |
|---|---|---|---|---|---|
| **CSMA_CONF3** | 4C | 4C | 7:0 | BU_CNTR_SEED[14:8] | MSB part of the seed for the random generator used to apply the CSMA algorithm. |
| **CSMA_CONF2** | 4D | 00 | 7:0 | BU_CNTR_SEED[7:0] | LSB part of the seed for the random generator used to apply the CSMA algorithm. |
| **CSMA_CONF1** | 4E | 04 | 7:2 | BU_PRSC | Prescaler value for the back-off unit BU. |
| | | | 1:0 | CCA_PERIOD | Multiplier for the Tcca timer. |
| **CSMA_CONF0** | 4F | 00 | 7:4 | CCA_LEN | The number of time in which the listen operation is performed. |
| | | | 3 | RESERVED | - |
| | | | 2:0 | NBACKOFF_MAX | Max number of back-off cycles. |
| **IRQ_MASK3** | 50 | 00 | 7:0 | INT_MASK[31:24] | Enable the routing of the interrupt flag on the configured IRQ GPIO. |
| **IRQ_MASK2** | 51 | 00 | 7:0 | INT_MASK[23:16] | Enable the routing of the interrupt flag on the configured IRQ GPIO. |
| **IRQ_MASK1** | 52 | 00 | 7:0 | INT_MASK[15:8] | Enable the routing of the interrupt flag on the configured IRQ GPIO. |
| **IRQ_MASK0** | 53 | 00 | 7:0 | INT_MASK[7:0] | Enable the routing of the interrupt flag on the configured IRQ GPIO. |
| **FAST_RX_TIMER** | 54 | 28 | 7:0 | RSSI_SETTLING_LIMIT | Sniff timer configuration. |
| **PA_POWER8** | 5A | 01 | 7 | RESERVED | - |
| | | | 6:0 | PA_LEVEL8 | Output power level for 8$^{th}$ slot. |

| Name | Addr | Default | Bit | Field name | Description |
|---|---|---|---|---|---|
| **IRQ_STATUS1** | FC | 05 | 7:0 | INT_LEVEL[15:8] | Interrupt status register 1 |
| **IRQ_STATUS0** | FD | 00 | 7:0 | INT_LEVEL[7:0] | Interrupt status register 0 |

# 11 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: www.st.com. ECOPACK is an ST trademark.

## 11.1 QFN24L (4x4 mm) package information

**Figure 30. QFN24L (4x4 mm) package outline**

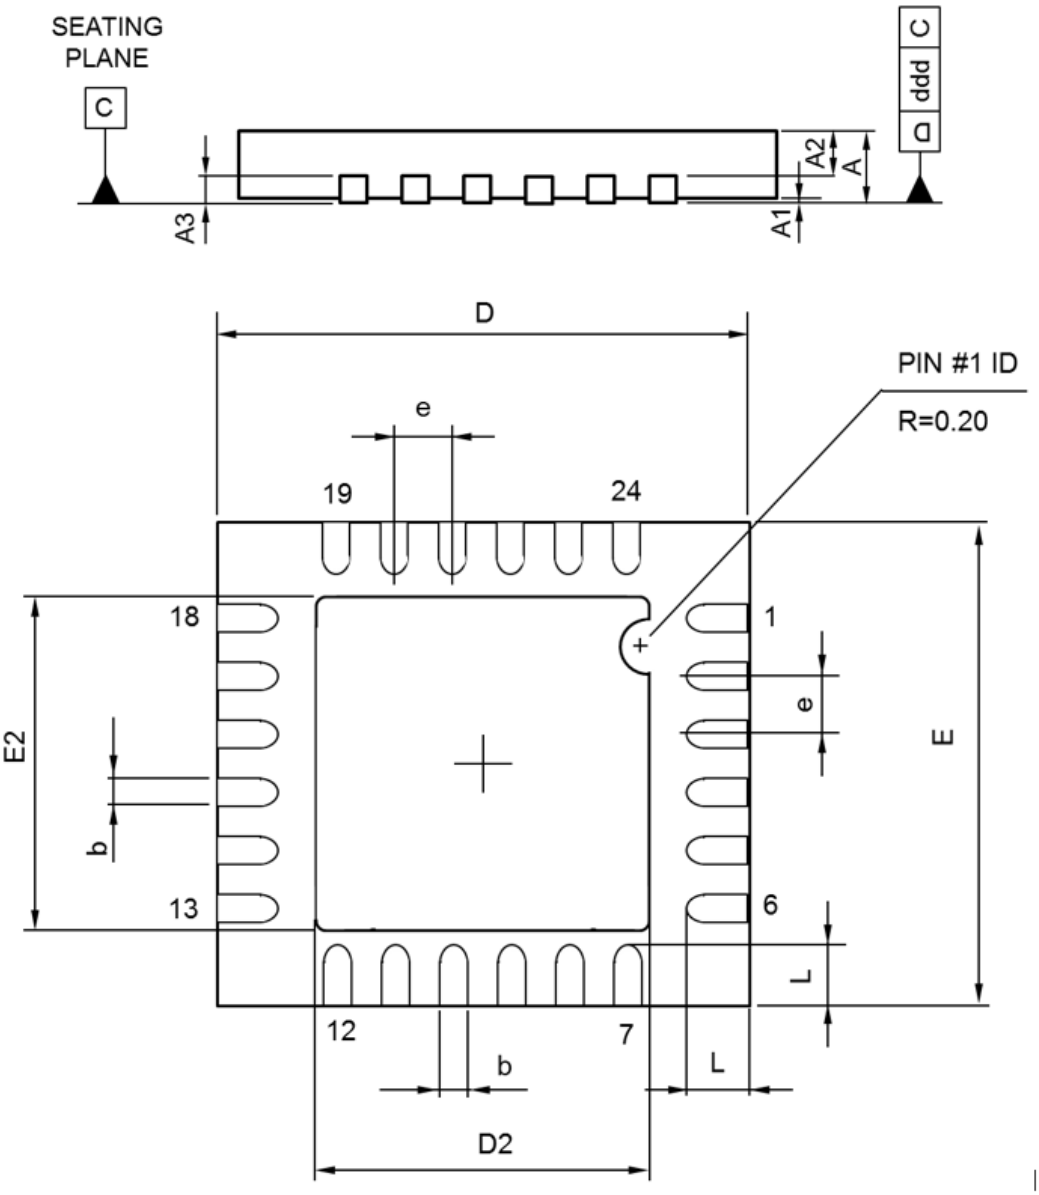

Table 64. **QFN24L (4x4 mm) package mechanical data**

| Dim. | mm | | |
|---|---|---|---|
| | Min. | Typ. | Max. |
| A | 0.95 | 1.00 | 1.05 |
| A1 | | 0.02 | 0.05 |
| A2 | | 0.65 | 1.00 |
| A3 | | 0.20 | |
| b | 0.18 | 0.25 | 0.30 |
| D | 3.85 | 4.00 | 4.15 |
| D2 | 2.60 | 2.70 | 2.80 |
| E | 3.85 | 4.00 | 4.15 |
| E2 | 2.60 | 2.70 | 2.80 |
| e | | 0.50 | |
| L | 0.35 | 0.40 | 0.45 |
| ddd | | | 0.08 |

## 11.2 PCB pad pattern

In order to design a proper pad pattern, tolerance analysis is required on package and motherboard dimensions. The tolerance analysis requires consideration of component tolerances, PCB tolerances and the accuracy of the equipment used to place the component.

For the pad dimensioning three different minimum values have been considered:

- Minimum toe fillet = JTmin = 0.1 mm
- Minimum heel fillet = JHmin = 0.05 mm
- Minimum side fillet = JSmin = 0 mm

The PCB thermal pad should at least match the exposed die paddle size. The solder mask opening should be 120 to 150 microns larger than the pad size resulting in 60 to 75 microns clearance between the copper pas and solder mask.

Figure 31. **QFN24 4x4x1pitch 0.5 mm PCB pad pattern**

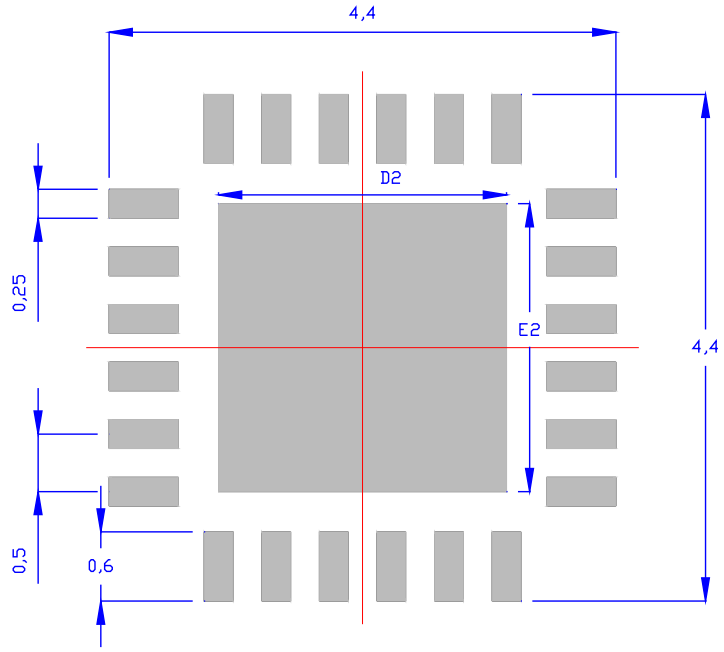

Table 65. **Exposed pad dimension**

| D2 (mm) | E2 (mm) |
|---|---|
| 2.70 | 2.70 |

## 11.3 QFN recommended profile parameters

The temperature profile is the most important control in the re-flow soldering and it must be fine tuned to establish a robust process. QFN recommended soldering profile for lead-free mounting is shown in the following table and picture.

Figure 32. **QFN recommended soldering profiles**

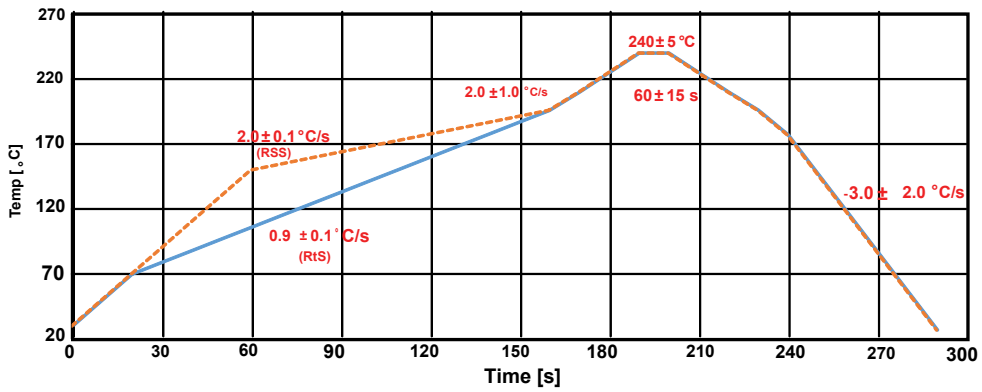

**Table 66. Temperature profiles**

| Profile | Ramp-to-spike | Ramp-soak-spike |
|---|---|---|
| Temperature gradient in preheat | T from 70 °C to 150 °C 0.8 °C/s to 1.0 °C/s | T from 70 °C to 150 °C 1 °C/s to 3 °C/s |
| Soak/dwell ( refer to solder paste supplier recommendation) | N/A or temp.: 150 °C to 200 °C, 40 to 80 s | Soak 150 °C to 200 °C, 40 to 100 s |
| Temperature gradient in preheat | Temp.: 200 °C to 225 °C, 1 °C/s to 3 °C/s | Temp.: 200 °C to 225 °C, 1 °C/s to 3 °C/s |
| Peak temperature | 235 °C to 245 °C | |
| Duration above 220 °C | 45 to 75 s | |
| Temperature gradient in cooling | -1 °C to -5 °C | |
| Time from 50 to 220 °C | 150 to 230 s | |

# 12 Ordering information

Table 67. **Ordering information**

| Order code | Package | Packing |
|---|---|---|
| S2-LPQTR | QFN24 4x4x1 | Tape and reel |
| S2-LPCBQTR | QFN24 4x4x1 | Tape and reel |

## Revision history

Table 68. **Document revision history**

| Date | Version | Changes |
|---|---|---|
| 08-Nov-2016 | 1 | Initial release. |
| 26-Jan-2017 | 2 | Minor text changes throughout the document. |
| 13-Mar-2018 | 3 | Updated Section Features, Section 1 Description, Section 5.1 Power management, Section 5.3 RF synthesizer, Section 5.3.1 RF channel frequency settings and Section 7.2 STack packet.<br>Updated Figure 13. Data whitening scheme.<br>Minor text changes throughout the document. |
| 10-May-2018 | 4 | Updated figure and features in cover page.<br>Updated Table 42. Constellation mapping 4-(G)FSK. |
| 06-Nov-2018 | 5 | Updated Figure 3. Suggested application diagram (embedded SMPS not used), Figure 5. Pin diagram, QFN24 (4x4 mm) package. Updated Section 4.4 Power consumption, Section 4.9 RF transmitter, Section 5.2 Power-On-Reset, Section 10 Register contents.<br>Added Section 11.3 QFN recommended profile parameters.<br>Minor text changes throughout the document. |
| 13-Jun-2019 | 6 | Updated Table 40. Modulation scheme and Table 62. Register contents. |
| 18-Sep-2020 | 7 | Added features "KNX-RF supported" on the cover page. |
| 06-May-2021 | 8 | Updated Table 63. Register contents. |
| 08-Sep-2021 | 9 | Updated Eq. (3), Figure 22. Flowchart of the S2-LP CSMA procedure, Figure 25. CSMA with non-persistent mode if channel is busy (timeline) and Figure 26. CSMA with non-persistent mode if channel becomes free (timeline).<br>Updated Figure 31. QFN24 4x4x1pitch 0.5 mm PCB pad pattern. |
| 28-Jun-2022 | 10 | Updated Section 4.1 Absolute maximum ratings, Section 4.8.2 Sensitivity at 433 MHz. Section 4.8.5 Blocking and selectivity at 868 MHz, Section 4.8.6 Sensitivity at 868 MHz, Section 4.8.8 Sensitivity at 915 MHz, Section 5.5.1 Automatic frequency compensation, Section 5.5.8.1 RSSI, Section 6 Operating modes, Section 6.1 Command list, Section 7.8.2 Manchester coding, Section 7.9 CRC, Section 8.1 Automatic acknowledgment, Section 8.2.1 Low duty cycle mode, Section 8.3 CSMA/CA engine, Section 10 Register contents.<br>Added Table 60. IRQ type S2-LP state. |
