

# STM32F072x8 STM32F072xB

ARM<sup>®</sup>-based 32-bit MCU, up to 128 KB Flash, crystal-less USB FS 2.0, CAN, 12 timers, ADC, DAC & comm. interfaces, 2.0 - 3.6 V

## Features

- Core: ARM<sup>®</sup> 32-bit Cortex<sup>®</sup>-M0 CPU, frequency up to 48 MHz
- Memories
  - 64 to 128 Kbytes of Flash memory
  - 16 Kbytes of SRAM with HW parity
- CRC calculation unit
- Reset and power management
  - Digital and I/O supply:  $V_{DD}$  = 2.0 V to 3.6 V
  - Analog supply: V<sub>DDA</sub> = V<sub>DD</sub> to 3.6 V
  - Selected I/Os: V<sub>DDIO2</sub> = 1.65 V to 3.6 V
  - Power-on/Power down reset (POR/PDR)
  - Programmable voltage detector (PVD)
  - Low power modes: Sleep, Stop, Standby
  - V<sub>BAT</sub> supply for RTC and backup registers
- Clock management
  - 4 to 32 MHz crystal oscillator
  - 32 kHz oscillator for RTC with calibration
  - Internal 8 MHz RC with x6 PLL option
  - Internal 40 kHz RC oscillator
  - Internal 48 MHz oscillator with automatic trimming based on ext. synchronization
- Up to 87 fast I/Os
  - All mappable on external interrupt vectors
  - Up to 68 I/Os with 5V tolerant capability and 19 with independent supply V<sub>DDIO2</sub>
- Seven-channel DMA controller
- One 12-bit, 1.0 µs ADC (up to 16 channels)
  - Conversion range: 0 to 3.6 V
  - Separate analog supply: 2.4 V to 3.6 V
- One 12-bit D/A converter (with 2 channels)
- Two fast low-power analog comparators with programmable input and output
- Up to 24 capacitive sensing channels for touchkey, linear and rotary touch sensors

WLCSP49

3.3x3.1 mm

- LQFP100 14x14 mm LQFP64 10x10 mm LQFP48 7x7 mm UFQFPX8 7x7 mm UFBGA64 5x5 mm
  - Calendar RTC with alarm and periodic wakeup from Stop/Standby
- 12 timers
  - One 16-bit advanced-control timer for six-channel PWM output
  - One 32-bit and seven 16-bit timers, with up to four IC/OC, OCN, usable for IR control decoding or DAC control
  - Independent and system watchdog timers
  - SysTick timer
- Communication interfaces
  - Two I<sup>2</sup>C interfaces supporting Fast Mode Plus (1 Mbit/s) with 20 mA current sink, one supporting SMBus/PMBus and wakeup
  - Four USARTs supporting master synchronous SPI and modem control, two with ISO7816 interface, LIN, IrDA, auto baud rate detection and wakeup feature
  - Two SPIs (18 Mbit/s) with 4 to 16 programmable bit frames, and with I<sup>2</sup>S interface multiplexed
  - CAN interface
  - USB 2.0 full-speed interface, able to run from internal 48 MHz oscillator and with BCD and LPM support
- HDMI CEC wakeup on header reception
- Serial wire debug (SWD)
- 96-bit unique ID
- All packages ECOPACK<sup>®</sup>2

#### Table 1. Device summary

## 1 Introduction

This datasheet provides the ordering information and mechanical device characteristics of the STM32F072x8/xB microcontrollers.

This document should be read in conjunction with the STM32F0xxxx reference manual (RM0091). The reference manual is available from the STMicroelectronics website *www.st.com*.

For information on the ARM<sup>®</sup> Cortex<sup>®</sup>-M0 core, please refer to the Cortex<sup>®</sup>-M0 Technical Reference Manual, available from the www.arm.com website.

## 2 Description

The STM32F072x8/xB microcontrollers incorporate the high-performance ARM<sup>®</sup> Cortex<sup>®</sup>-M0 32-bit RISC core operating at up to 48 MHz frequency, high-speed embedded memories (up to 128 Kbytes of Flash memory and 16 Kbytes of SRAM), and an extensive range of enhanced peripherals and I/Os. All devices offer standard communication interfaces (two I<sup>2</sup>Cs, two SPI/I<sup>2</sup>S, one HDMI CEC and four USARTs), one USB Full-speed device (crystal-less), one CAN, one 12-bit ADC, one 12-bit DAC with two channels, seven 16-bit timers, one 32-bit timer and an advanced-control PWM timer.

The STM32F072x8/xB microcontrollers operate in the -40 to +85 °C and -40 to +105 °C temperature ranges, from a 2.0 to 3.6 V power supply. A comprehensive set of power-saving modes allows the design of low-power applications.

The STM32F072x8/xB microcontrollers include devices in seven different packages ranging from 48 pins to 100 pins with a die form also available upon request. Depending on the device chosen, different sets of peripherals are included.

These features make the STM32F072x8/xB microcontrollers suitable for a wide range of applications such as application control and user interfaces, hand-held equipment, A/V receivers and digital TV, PC peripherals, gaming and GPS platforms, industrial applications, PLCs, inverters, printers, scanners, alarm systems, video intercoms and HVACs.

Table 2. STM32F072x8/xB family device features and peripheral counts

1. The SPI interface can be used either in SPI mode or in  $I^2S$  audio mode.

Figure 1. Block diagram

12/128

## 3 Functional overview

Figure 1 shows the general block diagram of the STM32F072x8/xB devices.

## 3.1 ARM<sup>®</sup>-Cortex<sup>®</sup>-M0 core

The ARM<sup>®</sup> Cortex<sup>®</sup>-M0 is a generation of ARM 32-bit RISC processors for embedded systems. It has been developed to provide a low-cost platform that meets the needs of MCU implementation, with a reduced pin count and low-power consumption, while delivering outstanding computational performance and an advanced system response to interrupts.

The ARM<sup>®</sup> Cortex<sup>®</sup>-M0 processors feature exceptional code-efficiency, delivering the high performance expected from an ARM core, with memory sizes usually associated with 8- and 16-bit devices.

The STM32F072x8/xB devices embed ARM core and are compatible with all ARM tools and software.

## 3.2 Memories

The device has the following features:

- 16 Kbytes of embedded SRAM accessed (read/write) at CPU clock speed with 0 wait states and featuring embedded parity checking with exception generation for fail-critical applications.
- The non-volatile memory is divided into two arrays:
  - 64 to 128 Kbytes of embedded Flash memory for programs and data
  - Option bytes

The option bytes are used to write-protect the memory (with 4 KB granularity) and/or readout-protect the whole memory with the following options:

- Level 0: no readout protection
- Level 1: memory readout protection, the Flash memory cannot be read from or written to if either debug features are connected or boot in RAM is selected
- Level 2: chip readout protection, debug features (Cortex<sup>®</sup>-M0 serial wire) and boot in RAM selection disabled

## 3.3 Boot modes

At startup, the boot pin and boot selector option bit are used to select one of the three boot options:

- boot from User Flash memory
- boot from System Memory
- boot from embedded SRAM

The boot loader is located in System Memory. It is used to reprogram the Flash memory by using USART on pins PA14/PA15, or PA9/PA10 or  $I^2C$  on pins PB6/PB7 or through the USB DFU interface.

## 3.4 Cyclic redundancy check calculation unit (CRC)

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code using a configurable generator polynomial value and size.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the EN/IEC 60335-1 standard, they offer a means of verifying the Flash memory integrity. The CRC calculation unit helps compute a signature of the software during runtime, to be compared with a reference signature generated at link-time and stored at a given memory location.

## 3.5 **Power management**

#### 3.5.1 Power supply schemes

- $V_{DD} = V_{DDIO1} = 2.0$  to 3.6 V: external power supply for I/Os ( $V_{DDIO1}$ ) and the internal regulator. It is provided externally through VDD pins.
- V<sub>DDA</sub> = from V<sub>DD</sub> to 3.6 V: external analog power supply for ADC, DAC, Reset blocks, RCs and PLL (minimum voltage to be applied to V<sub>DDA</sub> is 2.4 V when the ADC or DAC are used). It is provided externally through VDDA pin. The V<sub>DDA</sub> voltage level must be always greater or equal to the V<sub>DD</sub> voltage level and must be established first.
- V<sub>DDIO2</sub> = 1.65 to 3.6 V: external power supply for marked I/Os. V<sub>DDIO2</sub> is provided externally through the VDDIO2 pin. The V<sub>DDIO2</sub> voltage level is completely independent from V<sub>DD</sub> or V<sub>DDA</sub>, but it must not be provided without a valid supply on V<sub>DD</sub>. The V<sub>DDIO2</sub> supply is monitored and compared with the internal reference voltage (V<sub>REFINT</sub>). When the V<sub>DDIO2</sub> is below this threshold, all the I/Os supplied from this rail are disabled by hardware. The output of this comparator is connected to EXTI line 31 and it can be used to generate an interrupt. Refer to the pinout diagrams or tables for concerned I/Os list.
- V<sub>BAT</sub> = 1.65 to 3.6 V: power supply for RTC, external clock 32 kHz oscillator and backup registers (through power switch) when V<sub>DD</sub> is not present.

For more details on how to connect power pins, refer to *Figure 13: Power supply scheme*.

#### 3.5.2 Power supply supervisors

The device has integrated power-on reset (POR) and power-down reset (PDR) circuits. They are always active, and ensure proper operation above a threshold of 2 V. The device remains in reset mode when the monitored supply voltage is below a specified threshold,  $V_{POR/PDR}$ , without the need for an external reset circuit.

- The POR monitors only the V<sub>DD</sub> supply voltage. During the startup phase it is required that V<sub>DDA</sub> should arrive first and be greater than or equal to V<sub>DD</sub>.
- The PDR monitors both the V<sub>DD</sub> and V<sub>DDA</sub> supply voltages, however the V<sub>DDA</sub> power supply supervisor can be disabled (by programming a dedicated Option bit) to reduce the power consumption if the application design ensures that V<sub>DDA</sub> is higher than or equal to V<sub>DD</sub>.

The device features an embedded programmable voltage detector (PVD) that monitors the  $V_{DD}$  power supply and compares it to the  $V_{PVD}$  threshold. An interrupt can be generated when  $V_{DD}$  drops below the  $V_{PVD}$  threshold and/or when  $V_{DD}$  is higher than the  $V_{PVD}$ 

threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

#### 3.5.3 Voltage regulator

The regulator has two operating modes and it is always enabled after reset.

- Main (MR) is used in normal operating mode (Run).
- Low power (LPR) can be used in Stop mode where the power demand is reduced.

In Standby mode, it is put in power down mode. In this mode, the regulator output is in high impedance and the kernel circuitry is powered down, inducing zero consumption (but the contents of the registers and SRAM are lost).

#### 3.5.4 Low-power modes

The STM32F072x8/xB microcontrollers support three low-power modes to achieve the best compromise between low power consumption, short startup time and available wakeup sources:

#### Sleep mode

In Sleep mode, only the CPU is stopped. All peripherals continue to operate and can wake up the CPU when an interrupt/event occurs.

#### Stop mode

Stop mode achieves very low power consumption while retaining the content of SRAM and registers. All clocks in the 1.8 V domain are stopped, the PLL, the HSI RC and the HSE crystal oscillators are disabled. The voltage regulator can also be put either in normal or in low power mode.

The device can be woken up from Stop mode by any of the EXTI lines. The EXTI line source can be one of the 16 external lines, the PVD output, RTC, I2C1, USART1, USART2, USB, COMPx,  $V_{DDIO2}$  supply comparator or the CEC.

The CEC, USART1, USART2 and I2C1 peripherals can be configured to enable the HSI RC oscillator so as to get clock for processing incoming data. If this is used when the voltage regulator is put in low power mode, the regulator is first switched to normal mode before the clock is provided to the given peripheral.

#### Standby mode

The Standby mode is used to achieve the lowest power consumption. The internal voltage regulator is switched off so that the entire 1.8 V domain is powered off. The PLL, the HSI RC and the HSE crystal oscillators are also switched off. After entering Standby mode, SRAM and register contents are lost except for registers in the RTC domain and Standby circuitry.

The device exits Standby mode when an external reset (NRST pin), an IWDG reset, a rising edge on the WKUP pins, or an RTC event occurs.

Note: The RTC, the IWDG, and the corresponding clock sources are not stopped by entering Stop or Standby mode.

## 3.6 Clocks and startup

System clock selection is performed on startup, however the internal RC 8 MHz oscillator is selected as default CPU clock on reset. An external 4-32 MHz clock can be selected, in which case it is monitored for failure. If failure is detected, the system automatically switches

back to the internal RC oscillator. A software interrupt is generated if enabled. Similarly, full interrupt management of the PLL clock entry is available when necessary (for example on failure of an indirectly used external crystal, resonator or oscillator).

Figure 2. Clock tree

Several prescalers allow the application to configure the frequency of the AHB and the APB domains. The maximum frequency of the AHB and the APB domains is 48 MHz.

Additionally, also the internal RC 48 MHz oscillator can be selected for system clock or PLL input source. This oscillator can be automatically fine-trimmed by the means of the CRS peripheral using the external synchronization.

## 3.7 General-purpose inputs/outputs (GPIOs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions.

The I/O configuration can be locked if needed following a specific sequence in order to avoid spurious writing to the I/Os registers.

## 3.8 Direct memory access controller (DMA)

The 7-channel general-purpose DMAs manage memory-to-memory, peripheral-to-memory and memory-to-peripheral transfers.

The DMA supports circular buffer management, removing the need for user code intervention when the controller reaches the end of the buffer.

Each channel is connected to dedicated hardware DMA requests, with support for software trigger on each channel. Configuration is made by software and transfer sizes between source and destination are independent.

DMA can be used with the main peripherals: SPIx, I2Sx, I2Cx, USARTx, all TIMx timers (except TIM14), DAC and ADC.

## 3.9 Interrupts and events

#### 3.9.1 Nested vectored interrupt controller (NVIC)

The STM32F0xx family embeds a nested vectored interrupt controller able to handle up to 32 maskable interrupt channels (not including the 16 interrupt lines of  $Cortex^{\mathbb{R}}$ -M0) and 4 priority levels.

- Closely coupled NVIC gives low latency interrupt processing
- Interrupt entry vector table address passed directly to the core
- Closely coupled NVIC core interface
- Allows early processing of interrupts
- Processing of late arriving higher priority interrupts
- Support for tail-chaining
- Processor state automatically saved
- Interrupt entry restored on interrupt exit with no instruction overhead

This hardware block provides flexible interrupt management features with minimal interrupt latency.

#### 3.9.2 Extended interrupt/event controller (EXTI)

The extended interrupt/event controller consists of 32 edge detector lines used to generate interrupt/event requests and wake-up the system. Each line can be independently configured to select the trigger event (rising edge, falling edge, both) and can be masked independently. A pending register maintains the status of the interrupt requests. The EXTI can detect an external line with a pulse width shorter than the internal clock period. Up to 87 GPIOs can be connected to the 16 external interrupt lines.

## 3.10 Analog-to-digital converter (ADC)

The 12-bit analog-to-digital converter has up to 16 external and 3 internal (temperature sensor, voltage reference, VBAT voltage measurement) channels and performs conversions in single-shot or scan modes. In scan mode, automatic conversion is performed on a selected group of analog inputs.

The ADC can be served by the DMA controller.

An analog watchdog feature allows very precise monitoring of the converted voltage of one, some or all selected channels. An interrupt is generated when the converted voltage is outside the programmed thresholds.

#### 3.10.1 Temperature sensor

The temperature sensor (TS) generates a voltage  $V_{\mbox{\scriptsize SENSE}}$  that varies linearly with temperature.

The temperature sensor is internally connected to the ADC\_IN16 input channel which is used to convert the sensor output voltage into a digital value.

The sensor provides good linearity but it has to be calibrated to obtain good overall accuracy of the temperature measurement. As the offset of the temperature sensor varies from chip to chip due to process variation, the uncalibrated internal temperature sensor is suitable for applications that detect temperature changes only.

To improve the accuracy of the temperature sensor measurement, each device is individually factory-calibrated by ST. The temperature sensor factory calibration data are stored by ST in the system memory area, accessible in read-only mode.

| Calibration value name | Description  | Memory address            |
|------------------------|--|---------------------------|
| TS_CAL1                | TS ADC raw data acquired at a temperature of 30 °C ( $\pm$ 5 °C), V <sub>DDA</sub> = 3.3 V ( $\pm$ 10 mV)  | 0x1FFF F7B8 - 0x1FFF F7B9 |
| TS_CAL2                | TS ADC raw data acquired at a temperature of 110 °C ( $\pm$ 5 °C), V <sub>DDA</sub> = 3.3 V ( $\pm$ 10 mV) | 0x1FFF F7C2 - 0x1FFF F7C3 |

#### 3.10.2 Internal voltage reference (V<sub>REFINT</sub>)

The internal voltage reference ( $V_{REFINT}$ ) provides a stable (bandgap) voltage output for the ADC and comparators.  $V_{REFINT}$  is internally connected to the ADC\_IN17 input channel. The

precise voltage of  $V_{REFINT}$  is individually measured for each part by ST during production test and stored in the system memory area. It is accessible in read-only mode.

| Calibration value name | Description  | Memory address            |
|------------------------|--|---------------------------|
| VREFINT_CAL            | Raw data acquired at a temperature of 30 °C ( $\pm$ 5 °C), V <sub>DDA</sub> = 3.3 V ( $\pm$ 10 mV) | 0x1FFF F7BA - 0x1FFF F7BB |

Table 4. Internal voltage reference calibration values

#### 3.10.3 V<sub>BAT</sub> battery voltage monitoring

This embedded hardware feature allows the application to measure the V<sub>BAT</sub> battery voltage using the internal ADC channel ADC\_IN18. As the V<sub>BAT</sub> voltage may be higher than V<sub>DDA</sub>, and thus outside the ADC input range, the V<sub>BAT</sub> pin is internally connected to a bridge divider by 2. As a consequence, the converted digital value is half the V<sub>BAT</sub> voltage.

## 3.11 Digital-to-analog converter (DAC)

The two 12-bit buffered DAC channels can be used to convert digital signals into analog voltage signal outputs. The chosen design structure is composed of integrated resistor strings and an amplifier in non-inverting configuration.

This digital Interface supports the following features:

- 8-bit or 12-bit monotonic output
- Left or right data alignment in 12-bit mode
- Synchronized update capability
- Noise-wave generation
- Triangular-wave generation
- Dual DAC channel independent or simultaneous conversions
- DMA capability for each channel
- External triggers for conversion

Six DAC trigger inputs are used in the device. The DAC is triggered through the timer trigger outputs and the DAC interface is generating its own DMA requests.

## 3.12 Comparators (COMP)

The device embeds two fast rail-to-rail low-power comparators with programmable reference voltage (internal or external), hysteresis and speed (low speed for low power) and with selectable output polarity.

The reference voltage can be one of the following:

- External I/O
- DAC output pins
- Internal reference voltage or submultiple (1/4, 1/2, 3/4). Refer to *Table 28: Embedded internal reference voltage* for the value and precision of the internal reference voltage.

Both comparators can wake up from STOP mode, generate interrupts and breaks for the timers and can be also combined into a window comparator.

## 3.13 Touch sensing controller (TSC)

The STM32F072x8/xB devices provide a simple solution for adding capacitive sensing functionality to any application. These devices offer up to 24 capacitive sensing channels distributed over 8 analog I/O groups.

Capacitive sensing technology is able to detect the presence of a finger near a sensor which is protected from direct touch by a dielectric (glass, plastic...). The capacitive variation introduced by the finger (or any conductive object) is measured using a proven implementation based on a surface charge transfer acquisition principle. It consists in charging the sensor capacitance and then transferring a part of the accumulated charges into a sampling capacitor until the voltage across this capacitor has reached a specific threshold. To limit the CPU bandwidth usage, this acquisition is directly managed by the hardware touch sensing controller and only requires few external components to operate. For operation, one capacitive sensing GPIO in each group is connected to an external capacitor and cannot be used as effective touch sensing channel.

The touch sensing controller is fully supported by the STMTouch touch sensing firmware library, which is free to use and allows touch sensing functionality to be implemented reliably in the end application.

| Group | Capacitive sensing<br>signal name | Pin<br>name | Group | Capacitive sensing<br>signal name | Pin<br>name |
|-------|-----------------------------------|-------------|-------|-----------------------------------|-------------|
|       | TSC_G1_IO1                        | PA0         |       | TSC_G5_IO1                        | PB3         |
| 1     | TSC_G1_IO2                        | PA1         | 5     | TSC_G5_IO2                        | PB4         |
| 1     | TSC_G1_IO3                        | PA2         | 5     | TSC_G5_IO3                        | PB6         |
|       | TSC_G1_IO4                        | PA3         |       | TSC_G5_IO4                        | PB7         |
|       | TSC_G2_IO1                        | PA4         |       | TSC_G6_IO1                        | PB11        |
| 2     | TSC_G2_IO2                        | PA5         | 6     | TSC_G6_IO2                        | PB12        |
| 2     | TSC_G2_IO3                        | PA6         | 0     | TSC_G6_IO3                        | PB13        |
|       | TSC_G2_IO4                        | PA7         |       | TSC_G6_IO4                        | PB14        |
| 3     | TSC_G3_IO1                        | PC5         |       | TSC_G7_IO1                        | PE2         |
|       | TSC_G3_IO2                        | PB0         | 7     | TSC_G7_IO2                        | PE3         |
| 3     | TSC_G3_IO3                        | PB1         |       | TSC_G7_IO3                        | PE4         |
|       | TSC_G3_IO4                        | PB2         |       | TSC_G7_IO4                        | PE5         |
|       | TSC_G4_IO1                        | PA9         |       | TSC_G8_IO1                        | PD12        |
| 4     | TSC_G4_IO2                        | PA10        | 8     | TSC_G8_IO2                        | PD13        |
| 4     | TSC_G4_IO3                        | PA11        | 0     | TSC_G8_IO3                        | PD14        |
|       | TSC_G4_IO4                        | PA12        |       | TSC_G8_IO4                        | PD15        |

Table 5. Capacitive sensing GPIOs available on STM32F072x8/xB devices

|                                       | Number of capacitive sensing channels |             |             |  |  |
|---------------------------------------|---------------------------------------|-------------|-------------|--|--|
| Analog I/O group                      | STM32F072Vx                           | STM32F072Rx | STM32F072Cx |  |  |

#### Table 6. Number of capacitive sensing channels available on STM32F072x8/xB devices

## 3.14 Timers and watchdogs

The STM32F072x8/xB devices include up to six general-purpose timers, two basic timers and an advanced control timer.

Table 7 compares the features of the different timers.

| Timer<br>type      | Timer          | Counter resolution | Counter<br>type      | Prescaler<br>factor        | DMA<br>request<br>generation | Capture/compare<br>channels | Complementary<br>outputs |
|--------------------|----------------|--------------------|----------------------|----------------------------|------------------------------|-----------------------------|--------------------------|
| Advanced control   | TIM1           | 16-bit             | Up, down,<br>up/down | integer from<br>1 to 65536 | Yes                          | 4                           | 3                        |
|                    | TIM2           | 32-bit             | Up, down,<br>up/down | integer from<br>1 to 65536 | Yes                          | 4                           | -                        |
|                    | TIM3           | 16-bit             | Up, down,<br>up/down | integer from<br>1 to 65536 | Yes                          | 4                           | -                        |
| General<br>purpose | TIM14          | 16-bit             | Up                   | integer from<br>1 to 65536 | No                           | 1                           | -                        |
|                    | TIM15          | 16-bit             | Up                   | integer from<br>1 to 65536 | Yes                          | 2                           | 1                        |
|                    | TIM16<br>TIM17 | 16-bit             | Up                   | integer from<br>1 to 65536 | Yes                          | 1                           | 1                        |
| Basic              | TIM6<br>TIM7   | 16-bit             | Up                   | integer from<br>1 to 65536 | Yes                          | -                           | -                        |

Table 7. Timer feature comparison

## 3.14.1 Advanced-control timer (TIM1)

The advanced-control timer (TIM1) can be seen as a three-phase PWM multiplexed on six channels. It has complementary PWM outputs with programmable inserted dead times. It can also be seen as a complete general-purpose timer. The four independent channels can be used for:

- input capture
- output compare
- PWM generation (edge or center-aligned modes)
- one-pulse mode output

If configured as a standard 16-bit timer, it has the same features as the TIMx timer. If configured as the 16-bit PWM generator, it has full modulation capability (0-100%).

The counter can be frozen in debug mode.

Many features are shared with those of the standard timers which have the same architecture. The advanced control timer can therefore work together with the other timers via the Timer Link feature for synchronization or event chaining.

## 3.14.2 General-purpose timers (TIM2, 3, 14, 15, 16, 17)

There are six synchronizable general-purpose timers embedded in the STM32F072x8/xB devices (see *Table 7* for differences). Each general-purpose timer can be used to generate PWM outputs, or as simple time base.

#### TIM2, TIM3

STM32F072x8/xB devices feature two synchronizable 4-channel general-purpose timers. TIM2 is based on a 32-bit auto-reload up/downcounter and a 16-bit prescaler. TIM3 is based on a 16-bit auto-reload up/downcounter and a 16-bit prescaler. They feature 4 independent channels each for input capture/output compare, PWM or one-pulse mode output. This gives up to 12 input captures/output compares/PWMs on the largest packages.

The TIM2 and TIM3 general-purpose timers can work together or with the TIM1 advancedcontrol timer via the Timer Link feature for synchronization or event chaining.

TIM2 and TIM3 both have independent DMA request generation.

These timers are capable of handling quadrature (incremental) encoder signals and the digital outputs from 1 to 3 hall-effect sensors.

Their counters can be frozen in debug mode.

#### TIM14

This timer is based on a 16-bit auto-reload upcounter and a 16-bit prescaler.

TIM14 features one single channel for input capture/output compare, PWM or one-pulse mode output.

Its counter can be frozen in debug mode.

#### TIM15, TIM16 and TIM17

These timers are based on a 16-bit auto-reload upcounter and a 16-bit prescaler.

TIM15 has two independent channels, whereas TIM16 and TIM17 feature one single channel for input capture/output compare, PWM or one-pulse mode output.

The TIM15, TIM16 and TIM17 timers can work together, and TIM15 can also operate with TIM1 via the Timer Link feature for synchronization or event chaining.

TIM15 can be synchronized with TIM16 and TIM17.

TIM15, TIM16 and TIM17 have a complementary output with dead-time generation and independent DMA request generation.

Their counters can be frozen in debug mode.

#### 3.14.3 Basic timers TIM6 and TIM7

These timers are mainly used for DAC trigger generation. They can also be used as generic 16-bit time bases.

#### 3.14.4 Independent watchdog (IWDG)

The independent watchdog is based on an 8-bit prescaler and 12-bit downcounter with user-defined refresh window. It is clocked from an independent 40 kHz internal RC and as it operates independently from the main clock, it can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free running timer for application timeout management. It is hardware or software configurable through the option bytes. The counter can be frozen in debug mode.

#### 3.14.5 System window watchdog (WWDG)

The system window watchdog is based on a 7-bit downcounter that can be set as free running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the APB clock (PCLK). It has an early warning interrupt capability and the counter can be frozen in debug mode.

#### 3.14.6 SysTick timer

This timer is dedicated to real-time operating systems, but could also be used as a standard down counter. It features:

- a 24-bit down counter
- autoreload capability
- maskable system interrupt generation when the counter reaches 0
- programmable clock source (HCLK or HCLK/8)

## 3.15 Real-time clock (RTC) and backup registers

The RTC and the five backup registers are supplied through a switch that takes power either on  $V_{DD}$  supply when present or through the  $V_{BAT}$  pin. The backup registers are five 32-bit registers used to store 20 bytes of user application data when  $V_{DD}$  power is not present. They are not reset by a system or power reset, or at wake up from Standby mode.

The RTC is an independent BCD timer/counter. Its main features are the following:

- calendar with subseconds, seconds, minutes, hours (12 or 24 format), week day, date, month, year, in BCD (binary-coded decimal) format
- automatic correction for 28, 29 (leap year), 30, and 31 day of the month
- programmable alarm with wake up from Stop and Standby mode capability
- Periodic wakeup unit with programmable resolution and period.
- on-the-fly correction from 1 to 32767 RTC clock pulses. This can be used to synchronize the RTC with a master clock
- digital calibration circuit with 1 ppm resolution, to compensate for quartz crystal inaccuracy
- Three anti-tamper detection pins with programmable filter. The MCU can be woken up from Stop and Standby modes on tamper event detection
- timestamp feature which can be used to save the calendar content. This function can be triggered by an event on the timestamp pin, or by a tamper event. The MCU can be woken up from Stop and Standby modes on timestamp event detection
- reference clock detection: a more precise second source clock (50 or 60 Hz) can be used to enhance the calendar precision

The RTC clock sources can be:

- a 32.768 kHz external crystal
- a resonator or oscillator
- the internal low-power RC oscillator (typical frequency of 40 kHz)
- the high-speed external clock divided by 32

## 3.16 Inter-integrated circuit interface (I<sup>2</sup>C)

Up to two I<sup>2</sup>C interfaces (I2C1 and I2C2) can operate in multimaster or slave modes. Both can support Standard mode (up to 100 kbit/s), Fast mode (up to 400 kbit/s) and Fast Mode Plus (up to 1 Mbit/s) with 20 mA output drive on most of the associated I/Os.

Both support 7-bit and 10-bit addressing modes, multiple 7-bit slave addresses (two addresses, one with configurable mask). They also include programmable analog and digital noise filters.

| Aspect                              | Analog filter   | Digital filter   |
|-------------------------------------|---|--|
| Pulse width of<br>suppressed spikes | ≥ 50 ns   | Programmable length from 1 to 15<br>I2Cx peripheral clocks   |
| Benefits                            | Available in Stop mode                                | <ul> <li>Extra filtering capability vs.</li> <li>standard requirements</li> <li>Stable length</li> </ul> |
| Drawbacks                           | Variations depending on temperature, voltage, process | Wakeup from Stop on address<br>match is not available when digital<br>filter is enabled.                 |

In addition, I2C1 provides hardware support for SMBUS 2.0 and PMBUS 1.1: ARP capability, Host notify protocol, hardware CRC (PEC) generation/verification, timeouts

verifications and ALERT protocol management. I2C1 also has a clock domain independent from the CPU clock, allowing the I2C1 to wake up the MCU from Stop mode on address match.

The I2C peripherals can be served by the DMA controller.

Refer to *Table 9* for the differences between I2C1 and I2C2.

# 3.17 Universal synchronous/asynchronous receiver/transmitter (USART)

The device embeds four universal synchronous/asynchronous receivers/transmitters (USART1, USART2, USART3, USART4) which communicate at speeds of up to 6 Mbit/s.

They provide hardware management of the CTS, RTS and RS485 DE signals, multiprocessor communication mode, master synchronous communication and single-wire half-duplex communication mode. USART1 and USART2 support also SmartCard communication (ISO 7816), IrDA SIR ENDEC, LIN Master/Slave capability and auto baud rate feature, and have a clock domain independent of the CPU clock, allowing to wake up the MCU from Stop mode.

The USART interfaces can be served by the DMA controller.

# 3.18 Serial peripheral interface (SPI) / Inter-integrated sound interface (I<sup>2</sup>S)

Two SPIs are able to communicate up to 18 Mbit/s in slave and master modes in full-duplex and half-duplex communication modes. The 3-bit prescaler gives 8 master mode frequencies and the frame size is configurable from 4 bits to 16 bits.

Two standard I<sup>2</sup>S interfaces (multiplexed with SPI1 and SPI2 respectively) supporting four different audio standards can operate as master or slave at half-duplex communication mode. They can be configured to transfer 16 and 24 or 32 bits with 16-bit or 32-bit data resolution and synchronized by a specific signal. Audio sampling frequency from 8 kHz up to 192 kHz can be set by an 8-bit programmable linear prescaler. When operating in master mode, they can output a clock for an external audio component at 256 times the sampling frequency.

| TI mode                     | Х             |

1. X = supported.

# 3.19 High-definition multimedia interface (HDMI) - consumer electronics control (CEC)

The device embeds a HDMI-CEC controller that provides hardware support for the Consumer Electronics Control (CEC) protocol (Supplement 1 to the HDMI standard).

This protocol provides high-level control functions between all audiovisual products in an environment. It is specified to operate at low speeds with minimum processing and memory

overhead. It has a clock domain independent from the CPU clock, allowing the HDMI\_CEC controller to wakeup the MCU from Stop mode on data reception.

## 3.20 Controller area network (CAN)

The CAN is compliant with specifications 2.0A and B (active) with a bit rate up to 1 Mbit/s. It can receive and transmit standard frames with 11-bit identifiers as well as extended frames with 29-bit identifiers. It has three transmit mailboxes, two receive FIFOs with 3 stages and 14 scalable filter banks.

## 3.21 Universal serial bus (USB)

The STM32F072x8/xB embeds a full-speed USB device peripheral compliant with the USB specification version 2.0. The internal USB PHY supports USB FS signaling, embedded DP pull-up and also battery charging detection according to Battery Charging Specification Revision 1.2. The USB interface implements a full-speed (12 Mbit/s) function interface with added support for USB 2.0 Link Power Management. It has software-configurable endpoint setting with packet memory up-to 1 KB (the last 256 byte are used for CAN peripheral if enabled) and suspend/resume support. It requires a precise 48 MHz clock which can be generated from the internal main PLL (the clock source must use an HSE crystal oscillator) or by the internal 48 MHz oscillator in automatic trimming mode. The synchronization for this oscillator can be taken from the USB data stream itself (SOF signalization) which allows crystal-less operation.

## 3.22 Clock recovery system (CRS)

The STM32F072x8/xB embeds a special block which allows automatic trimming of the internal 48 MHz oscillator to guarantee its optimal accuracy over the whole device operational range. This automatic trimming is based on the external synchronization signal, which could be either derived from USB SOF signalization, from LSE oscillator, from an external signal on CRS\_SYNC pin or generated by user software. For faster lock-in during startup it is also possible to combine automatic trimming with manual trimming action.

## 3.23 Serial wire debug port (SW-DP)

An ARM SW-DP interface is provided to allow a serial wire debugging tool to be connected to the MCU.

Table 13. STM32F072x8/xB pin definitions (continued)

PC13, PC14 and PC15 are supplied through the power switch. Since the switch only sinks a limited amount of current (3 mA), the use of GPIOs PC13 to PC15 in output mode is limited:
 The speed should not exceed 2 MHz with a maximum load of 30 pF.

- These GPIOs must not be used as current sources (e.g. to drive an LED).

After the first RTC domain power-up, PC13, PC14 and PC15 operate as GPIOs. Their function then depends on the content of the RTC registers which are not reset by the system reset. For details on how to manage these GPIOs, refer to the RTC domain and RTC register descriptions in the reference manual.

3. PC6, PC7, PC8, PC9, PA8, PA9, PA10, PA11, PA12, PA13, PF6, PA14, PA15, PC10, PC11, PC12, PD0, PD1 and PD2 I/Os are supplied by VDDIO2.

After reset, these pins are configured as SWDIO and SWCLK alternate functions, and the internal pull-up on the SWDIO pin and the internal pull-down on the SWCLK pin are activated. 4.

# 6 Electrical characteristics

## 6.1 Parameter conditions

Unless otherwise specified, all voltages are referenced to V<sub>SS</sub>.

## 6.1.1 Minimum and maximum values

Unless otherwise specified, the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at  $T_A = 25$  °C and  $T_A = T_A max$  (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation (mean  $\pm 3\sigma$ ).

## 6.1.2 Typical values

Unless otherwise specified, typical data are based on  $T_A = 25$  °C,  $V_{DD} = V_{DDA} = 3.3$  V. They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated (mean  $\pm 2\sigma$ ).

## 6.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

## 6.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in *Figure 11*.

## 6.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in *Figure 12*.

## 6.1.6 Power supply scheme

Figure 13. Power supply scheme

**Caution:** Each power supply pair (V<sub>DD</sub>/V<sub>SS</sub>, V<sub>DDA</sub>/V<sub>SSA</sub> etc.) must be decoupled with filtering ceramic capacitors as shown above. These capacitors must be placed as close as possible to, or below, the appropriate pins on the underside of the PCB to ensure the good functionality of the device.

## 6.1.7 Current consumption measurement

#### Figure 14. Current consumption measurement scheme

50/128

## 6.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in *Table 21: Voltage characteristics*, *Table 22: Current characteristics* and *Table 23: Thermal characteristics* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

| Symbol                              | Ratings   | Min                                  | Мах                     | Unit |

| Table 21. Voltage ch | aracteristics <sup>(1)</sup> |
|----------------------|------------------------------|
|----------------------|------------------------------|

1. All main power ( $V_{DD}$ ,  $V_{DDA}$ ) and ground ( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply, in the permitted range.

2. V<sub>IN</sub> maximum must always be respected. Refer to *Table 22: Current characteristics* for the maximum allowed injected current values.

3. Valid only if the internal pull-up/pull-down resistors are disabled. If internal pull-up or pull-down resistor is enabled, the maximum limit is 4 V.

| Symbol                               | Ratings   | Max.                 | Unit |

| I <sub>INJ(PIN)</sub> <sup>(3)</sup> | Injected current on TC and RST pin  | ± 5                  | 1    |
|                                      | Injected current on TTa pins <sup>(5)</sup>                                     | ± 5                  | 1    |
| ΣΙ <sub>INJ(PIN)</sub>               | Total injected current (sum of all I/O and control pins) <sup>(6)</sup>         | ± 25                 | 1    |

#### Table 22. Current characteristics

1. All main power (VDD, VDDA) and ground (VSS, VSSA) pins must always be connected to the external power supply, in the permitted range.

2. This current consumption must be correctly distributed over all I/Os and control pins. The total output current must not be sunk/sourced between two consecutive power supply pins referring to high pin count QFP packages.

3. A positive injection is induced by  $V_{IN} > V_{DDIOx}$  while a negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer to *Table 21: Voltage characteristics* for the maximum allowed input voltage values.

4. Positive injection is not possible on these I/Os and does not occur for input voltages lower than the specified maximum value.

5. On these I/Os, a positive injection is induced by  $V_{IN} > V_{DDA}$ . Negative injection disturbs the analog performance of the device. See note <sup>(2)</sup> below *Table 59: ADC accuracy*.

 When several inputs are submitted to a current injection, the maximum ΣI<sub>INJ(PIN)</sub> is the absolute sum of the positive and negative injected currents (instantaneous values).

#### Table 23. Thermal characteristics

| Symbol           | Ratings                      | Value       | Unit |
|------------------|------------------------------|-------------|------|
| T <sub>STG</sub> | Storage temperature range    | –65 to +150 | °C   |
| TJ               | Maximum junction temperature | 150         | °C   |

#### Table 24. General operating conditions

1. For operation with a voltage higher than  $V_{DDIOx}$  + 0.3 V, the internal pull-up resistor must be disabled.

2. If  $T_A$  is lower, higher  $P_D$  values are allowed as long as  $T_J$  does not exceed  $T_{Jmax}$ . See Section 7.8: Thermal characteristics.

 In low power dissipation state, T<sub>A</sub> can be extended to this range as long as T<sub>J</sub> does not exceed T<sub>Jmax</sub> (see Section 7.8: Thermal characteristics).

## 6.3.2 Operating conditions at power-up / power-down

The parameters given in *Table 25* are derived from tests performed under the ambient temperature condition summarized in *Table 24*.

| Symbol            | Parameter                       | Conditions | Min | Max | Unit |
|-------------------|---------------------------------|------------|-----|-----|------|
| t <sub>VDD</sub>  | V <sub>DD</sub> rise time rate  |            | 0   | 8   | μs/V |
|                   | V <sub>DD</sub> fall time rate  | -          | 20  | 8   |      |
| +                 | V <sub>DDA</sub> rise time rate |            | 0   | ∞   | μ5/ν |
| t <sub>VDDA</sub> | V <sub>DDA</sub> fall time rate |            | 20  | 8   |      |

Table 25. Operating conditions at power-up / power-down

## 6.3.3 Embedded reset and power control block characteristics

The parameters given in *Table 26* are derived from tests performed under the ambient temperature and supply voltage conditions summarized in *Table 24: General operating conditions*.

| Symbol                               | Parameter            | Conditions                      | Min                 | Тур  | Max                 | Unit |
|--------------------------------------|----------------------|---------------------------------|---------------------|------|---------------------|------|
| V <sub>POR/PDR</sub> <sup>(1)</sup>  |                      | Falling edge <sup>(2)</sup> 1.8 | 1.80                | 1.88 | 1.96 <sup>(3)</sup> | V    |

Table 28. Embedded internal reference voltage

1. Guaranteed by design, not tested in production.

## 6.3.5 Supply current characteristics

The current consumption is a function of several parameters and factors such as the operating voltage, ambient temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code.

The current consumption is measured as described in *Figure 14: Current consumption measurement scheme*.

All Run-mode current consumption measurements given in this section are performed with a reduced code that gives a consumption equivalent to CoreMark code.

#### Typical and maximum current consumption

The MCU is placed under the following conditions:

- All I/O pins are in analog input mode
- All peripherals are disabled except when explicitly mentioned
- The Flash memory access time is adjusted to the f<sub>HCLK</sub> frequency:
  - 0 wait state and Prefetch OFF from 0 to 24 MHz
  - 1 wait state and Prefetch ON above 24 MHz
- When the peripherals are enabled f<sub>PCLK</sub> = f<sub>HCLK</sub>

The parameters given in *Table 29* to *Table 31* are derived from tests performed under ambient temperature and supply voltage conditions summarized in *Table 24: General operating conditions*.

|                 | er   |                                      |        | All  | peripher | als enab             | oled <sup>(1)</sup> | All  | periphe                             | rals disa | abled  |      |

## Table 29. Typical and maximum current consumption from $V_{DD}$ supply at $V_{DD}$ = 3.6 V (continued)

1. USB is kept disabled as this IP functions only with a 48 MHz clock.

2. Data based on characterization results, not tested in production unless otherwise specified.

3. Data based on characterization results and tested in production (using one common test limit for sum of  $I_{DD}$  and  $I_{DDA}$ ).

Table 30. Typical and maximum current consumption from the  $\ensuremath{\mathsf{V}_{\mathsf{DDA}}}$  supply

 Current consumption from the V<sub>DDA</sub> supply is independent of whether the digital peripherals are enabled or disabled, being in Run or Sleep mode or executing from Flash memory or RAM. Furthermore, when the PLL is off, I<sub>DDA</sub> is independent from the frequency.

2. Data based on characterization results, not tested in production unless otherwise specified.

3. Data based on characterization results and tested in production (using one common test limit for sum of I<sub>DD</sub> and I<sub>DDA</sub>).

Table 32. Typical and maximum current consumption from the  $\rm V_{BAT}$  supply

1. Data based on characterization results, not tested in production.

## Typical current consumption

The MCU is placed under the following conditions:

- V<sub>DD</sub> = V<sub>DDA</sub> = 3.3 V
- All I/O pins are in analog input configuration
- The Flash memory access time is adjusted to f<sub>HCLK</sub> frequency:
  - 0 wait state and Prefetch OFF from 0 to 24 MHz
  - 1 wait state and Prefetch ON above 24 MHz
- When the peripherals are enabled,  $f_{PCLK} = f_{HCLK}$
- PLL is used for frequencies greater than 8 MHz
- AHB prescaler of 2, 4, 8 and 16 is used for the frequencies 4 MHz, 2 MHz, 1 MHz and 500 kHz respectively

| Table 33. Typical current consumption, code executing from Flash memory, |
|--|
| running from HSE 8 MHz crystal   |

#### I/O system current consumption

The current consumption of the I/O system has two components: static and dynamic.

#### I/O static current consumption

All the I/Os used as inputs with pull-up generate current consumption when the pin is externally held low. The value of this current consumption can be simply computed by using the pull-up/pull-down resistors values given in *Table 53: I/O static characteristics*.

For the output pins, any external pull-down or external load must also be considered to estimate the current consumption.

Additional I/O current consumption is due to I/Os configured as inputs if an intermediate voltage level is externally applied. This current consumption is caused by the input Schmitt

trigger circuits used to discriminate the input value. Unless this specific configuration is required by the application, this supply current consumption can be avoided by configuring these I/Os in analog mode. This is notably the case of ADC input pins which should be configured as analog inputs.

**Caution:** Any floating input pin can also settle to an intermediate voltage level or switch inadvertently, as a result of external electromagnetic noise. To avoid current consumption related to floating pins, they must either be configured in analog mode, or forced internally to a definite digital value. This can be done either by using pull-up/down resistors or by configuring the pins in output mode.

#### I/O dynamic current consumption

In addition to the internal peripheral current consumption measured previously (see *Table 35: Peripheral current consumption*), the I/Os used by an application also contribute to the current consumption. When an I/O pin switches, it uses the current from the I/O supply voltage to supply the I/O pin circuitry and to charge/discharge the capacitive load (internal or external) connected to the pin:

$$I_{SW} = V_{DDIOx} \times f_{SW} \times C$$

where

 $I_{SW}$  is the current sunk by a switching I/O to charge/discharge the capacitive load  $V_{\text{DDIOx}}$  is the I/O supply voltage

 ${\rm f}_{\rm SW}$  is the I/O switching frequency

C is the total capacitance seen by the I/O pin: C =  $C_{INT}$  +  $C_{EXT}$  +  $C_S$ 

 $C_S$  is the PCB board capacitance including the pad pin.

The test pin is configured in push-pull output mode and is toggled by software at a fixed frequency.

Table 34. Switching output I/O current consumption

1. C<sub>S</sub> = 7 pF (estimated value).

#### **On-chip peripheral current consumption**

The current consumption of the on-chip peripherals is given in *Table 35*. The MCU is placed under the following conditions:

- All I/O pins are in analog mode
- All peripherals are disabled unless otherwise mentioned
- The given value is calculated by measuring the current consumption
  - with all peripherals clocked off
  - with only one peripheral clocked on
- Ambient operating temperature and supply voltage conditions summarized in *Table 21: Voltage characteristics*
- The power consumption of the digital part of the on-chip peripherals is given in *Table 35*. The power consumption of the analog part of the peripherals (where applicable) is indicated in each related section of the datasheet.

|     | Peripheral               | Typical consumption at 25 °C | Unit   |
|-----|--------------------------|------------------------------|--------|
|     | BusMatrix <sup>(1)</sup> | 2.2                          |        |

Table 35. Peripheral current consumption (continued)

1. The BusMatrix is automatically active when at least one master is ON (CPU, DMA).

2. The APB Bridge is automatically active when at least one peripheral is ON on the Bus.

 The power consumption of the analog part (I<sub>DDA</sub>) of peripherals such as ADC, DAC, Comparators, is not included. Refer to the tables of characteristics in the subsequent sections.

## 6.3.6 Wakeup time from low-power mode

The wakeup times given in *Table 36* are the latency between the event and the execution of the first user instruction. The device goes in low-power mode after the WFE (Wait For Event) instruction, in the case of a WFI (Wait For Interruption) instruction, 16 CPU cycles must be added to the following timings due to the interrupt latency in the Cortex M0 architecture.

The SYSCLK clock source setting is kept unchanged after wakeup from Sleep mode. During wakeup from Stop or Standby mode, SYSCLK takes the default setting: HSI 8 MHz.

The wakeup source from Sleep and Stop mode is an EXTI line configured in event mode. The wakeup source from Standby mode is the WKUP1 pin (PA0).

All timings are derived from tests performed under the ambient temperature and supply voltage conditions summarized in *Table 24: General operating conditions*.

## 6.3.7 External clock source characteristics

#### High-speed external user clock generated from an external source

In bypass mode the HSE oscillator is switched off and the input pin is a standard GPIO.

The external clock signal has to respect the I/O characteristics in Section 6.3.14. However, the recommended clock input waveform is shown in *Figure 15: High-speed external clock source AC timing diagram*.

| Symbol                                       | Parameter <sup>(1)</sup>             | Min                    | Тур | Max                    | Unit |

Table 38. Low-speed external user clock characteristics

1. Guaranteed by design, not tested in production.

#### High-speed external clock generated from a crystal/ceramic resonator

The high-speed external (HSE) clock can be supplied with a 4 to 32 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on design simulation results obtained with typical external components specified in *Table 39*. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

| Table 39. HSE oscillator characteristic |
|---|
|---|

1. Resonator characteristics given by the crystal/ceramic resonator manufacturer.

2. Guaranteed by design, not tested in production.

3. This consumption level occurs during the first 2/3 of the  $t_{\mbox{SU(HSE)}}$  startup time

4. t<sub>SU(HSE)</sub> is the startup time measured from the moment it is enabled (by software) to a stabilized 8 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer

For  $C_{L1}$  and  $C_{L2}$ , it is recommended to use high-quality external ceramic capacitors in the 5 pF to 20 pF range (Typ.), designed for high-frequency applications, and selected to match the requirements of the crystal or resonator (see *Figure 17*).  $C_{L1}$  and  $C_{L2}$  are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of  $C_{L1}$  and  $C_{L2}$ . PCB and MCU pin capacitance must be included (10 pF can be used as a rough estimate of the combined pin and board capacitance) when sizing  $C_{L1}$  and  $C_{L2}$ .

Note: For information on selecting the crystal, refer to the application note AN2867 "Oscillator design guide for ST microcontrollers" available from the ST website www.st.com.

68/128

Figure 17. Typical application with an 8 MHz crystal

1. R<sub>EXT</sub> value depends on the crystal characteristics.

#### Low-speed external clock generated from a crystal resonator

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal resonator oscillator. All the information given in this paragraph are based on design simulation results obtained with typical external components specified in *Table 40*. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

# 6.3.11 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

### Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling 2 LEDs through I/O ports). the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs:

- Electrostatic discharge (ESD) (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.
- FTB: A Burst of Fast Transient voltage (positive and negative) is applied to V<sub>DD</sub> and V<sub>SS</sub> through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in *Table 48*. They are based on the EMS levels and classes defined in application note AN1709.

| Table | 48. | EMS | characteristics |
|-------|-----|-----|-----------------|
|-------|-----|-----|-----------------|

| Symbol            | Parameter   | Conditions  | Level/<br>Class |
|-------------------|---|---|-----------------|
| V <sub>FESD</sub> | Voltage limits to be applied on any I/O pin to induce a functional disturbance  | $V_{DD}$ = 3.3 V, LQFP100, T <sub>A</sub> = +25 °C,<br>f <sub>HCLK</sub> = 48 MHz,<br>conforming to IEC 61000-4-2 | 2B              |
| V <sub>EFTB</sub> | Fast transient voltage burst limits to be applied through 100 pF on $V_{DD}$ and $V_{SS}$ pins to induce a functional disturbance | $V_{DD}$ = 3.3 V, LQFP100, T <sub>A</sub> = +25°C,<br>f <sub>HCLK</sub> = 48 MHz,<br>conforming to IEC 61000-4-4  | 4B              |

### Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

#### Software recommendations

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical Data corruption (for example control registers)

### Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

### **Electromagnetic Interference (EMI)**

The electromagnetic field emitted by the device are monitored while a simple application is executed (toggling 2 LEDs through the I/O ports). This emission test is compliant with IEC 61967-2 standard which specifies the test board and the pin loading.

| Symbol                     | Parameter   | Conditions      | Monitored        | Max vs. [f <sub>HSE</sub> /f <sub>HCLK</sub> ] | Unit |
|----------------------------|---|-----------------|------------------|--|------|

### Table 49. EMI characteristics

# 6.3.12 Electrical sensitivity characteristics

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

## **Electrostatic discharge (ESD)**

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts  $\times$  (n+1) supply pins). This test conforms to the JESD22-A114/C101 standard.

| Symbol                | Ratings  | Conditions   | Packages   | Class | Maximum<br>value <sup>(1)</sup> | Unit |  |
|-----------------------|--|--|------------|-------|---------------------------------|------|--|
| V <sub>ESD(HBM)</sub> | Electrostatic discharge voltage (human body model) | $T_A = +25 \degree C$ , conforming<br>to JESD22-A114 | All        | 2     | 2000                            | V    |  |
| V                     | Electrostatic discharge voltage                    | T <sub>A</sub> = +25 °C, conforming                  | WLCSP49    | C3    | 250                             | V    |  |
| VESD(CDM)             | (charge device model)                              | to ANSI/ESD STM5.3.1                                 | All others | C4    | 500                             | v    |  |

 Table 50. ESD absolute maximum ratings

1. Data based on characterization results, not tested in production.

### Static latch-up

Two complementary static tests are required on six parts to assess the latch-up performance:

- A supply overvoltage is applied to each power supply pin.
- A current injection is applied to each input, output and configurable I/O pin.

These tests are compliant with EIA/JESD 78A IC latch-up standard.

Table 51. Electrical sensitivities

| Symbol | Parameter             | Conditions                                    | Class      |
|--------|-----------------------|---|------------|
| LU     | Static latch-up class | $T_A = +105 \text{ °C conforming to JESD78A}$ | II level A |

# 6.3.13 I/O current injection characteristics

As a general rule, current injection to the I/O pins, due to external voltage below  $V_{SS}$  or above  $V_{DDIOx}$  (for standard, 3.3 V-capable I/O pins) should be avoided during normal product operation. However, in order to give an indication of the robustness of the microcontroller in cases when abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during device characterization.

### Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out of range parameter: ADC error above a certain limit (higher than 5 LSB TUE), out of conventional limits of induced leakage current on adjacent pins (out of the -5  $\mu$ A/+0  $\mu$ A range) or other functional failure (for example reset occurrence or oscillator frequency deviation).

The characterization results are given in *Table 52*.

Negative induced leakage current is caused by negative injection and positive induced leakage current is caused by positive injection.

| Symbol           | Description  | Func<br>suscer | Unit               |     |
|------------------|--|----------------|--------------------|-----|
|                  | Description -  |                | Positive injection | onn |
|                  | Injected current on BOOT0 and PF1 pins   | -0             | NA                 |     |
|                  | Injected current on PC0 pin  | -0             | +5                 |     |
| I <sub>INJ</sub> | Injected current on PA11 and PA12 pins with induced leakage current on adjacent pins less than -1 mA | -5             | NA                 | mA  |
|                  | Injected current on all other FT and FTf pins  | -5             | NA                 |     |
|                  | Injected current on all other TTa, TC and RST pins   | -5             | +5                 |     |

## Table 52. I/O current injection susceptibility

# 6.3.14 I/O port characteristics

### General input/output characteristics

Unless otherwise specified, the parameters given in *Table 53* are derived from tests performed under the conditions summarized in *Table 24: General operating conditions*. All I/Os are designed as CMOS- and TTL-compliant (except BOOT0).

| Table 53. | . I/O static | characteristics | (continued) |
|-----------|--------------|-----------------|-------------|
|-----------|--------------|-----------------|-------------|

1. Data based on design simulation only. Not tested in production.

2. The leakage could be higher than the maximum value, if negative current is injected on adjacent pins. Refer to Table 52: I/O current injection susceptibility.

 Pull-up and pull-down resistors are designed with a true resistance in series with a switchable PMOS/NMOS. This PMOS/NMOS contribution to the series resistance is minimal (~10% order).

All I/Os are CMOS- and TTL-compliant (no software configuration required). Their characteristics cover more than the strict CMOS-technology or TTL parameters. The coverage of these requirements is shown in *Figure 22* for standard I/Os, and in *Figure 23* for 5 V-tolerant I/Os. The following curves are design simulation results, not tested in production.

### **Output driving current**

The GPIOs (general purpose input/outputs) can sink or source up to +/-8 mA, and sink or source up to +/- 20 mA (with a relaxed  $V_{OL}/V_{OH}$ ).

In the user application, the number of I/O pins which can drive current must be limited to respect the absolute maximum rating specified in *Section 6.2*:

- The sum of the currents sourced by all the I/Os on V<sub>DDIOx</sub>, plus the maximum consumption of the MCU sourced on V<sub>DD</sub>, cannot exceed the absolute maximum rating ΣI<sub>VDD</sub> (see *Table 21: Voltage characteristics*).
- The sum of the currents sunk by all the I/Os on V<sub>SS</sub>, plus the maximum consumption of the MCU sunk on V<sub>SS</sub>, cannot exceed the absolute maximum rating ΣI<sub>VSS</sub> (see *Table 21: Voltage characteristics*).

### **Output voltage levels**

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature and supply voltage conditions summarized in *Table 24: General operating conditions.* All I/Os are CMOS- and TTL-compliant (FT, TTa or TC unless otherwise specified).

| Symbol                            | Parameter  | Conditions  | Min                     | Max | Unit |
|-----------------------------------|--|---|-------------------------|-----|------|

| V <sub>OH</sub> <sup>(4)</sup>    | Output high level voltage for an I/O pin                   | I <sub>IO</sub>   = 4 mA                                | V <sub>DDIOx</sub> -0.4 | -   | V    |
| V <sub>OLFm+</sub> <sup>(3)</sup> | Output low level voltage for an FTf I/O pin in<br>Fm+ mode | I <sub>IO</sub>   = 20 mA<br>V <sub>DDIOx</sub> ≥ 2.7 V | -                       | 0.4 | V    |
|                                   |  | I <sub>IO</sub>   = 10 mA                               | -                       | 0.4 | V    |

### Table 54. Output voltage characteristics<sup>(1)</sup>

 The I<sub>IO</sub> current sourced or sunk by the device must always respect the absolute maximum rating specified in Table 21: Voltage characteristics, and the sum of the currents sourced or sunk by all the I/Os (I/O ports and control pins) must always respect the absolute maximum ratings ΣI<sub>IO</sub>.

2. TTL and CMOS outputs are compatible with JEDEC standards JESD36 and JESD52.

3. Data based on characterization results. Not tested in production.

4. Data based on characterization results. Not tested in production.

## Input/output AC characteristics

The definition and values of input/output AC characteristics are given in *Figure 24* and *Table 55*, respectively. Unless otherwise specified, the parameters given are derived from tests performed under the ambient temperature and supply voltage conditions summarized in *Table 24: General operating conditions*.

Table 55. I/O AC characteristics<sup>(1)(2)</sup> (continued)

 The I/O speed is configured using the OSPEEDRx[1:0] bits. Refer to the STM32F0xxxx RM0091 reference manual for a description of GPIO Port configuration register.

2. Guaranteed by design, not tested in production.

- 3. The maximum frequency is defined in *Figure 24*.
- When Fm+ configuration is set, the I/O speed control is bypassed. Refer to the STM32F0xxxx reference manual RM0091 for a detailed description of Fm+ I/O configuration.

### Figure 24. I/O AC characteristics definition

# 6.3.15 NRST pin characteristics

The NRST pin input driver uses the CMOS technology. It is connected to a permanent pullup resistor,  $R_{PU}$ .

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature and supply voltage conditions summarized in *Table 24: General operating conditions*.

| Symbol                | Parameter                     | Conditions | Min   | Тур | Мах                                      | Unit |
|-----------------------|-------------------------------|------------|---|-----|--|------|
| V <sub>IL(NRST)</sub> | NRST input low level voltage  | -          | -   | -   | 0.3 V <sub>DD</sub> +0.07 <sup>(1)</sup> | V    |
| V <sub>IH(NRST)</sub> | NRST input high level voltage | -          | 0.445 V <sub>DD</sub> +0.398 <sup>(1)</sup> | -   | -  | v    |

Table 56. NRST pin characteristics

Table 56. NRST pin characteristics (continued)

1. Data based on design simulation only. Not tested in production.

The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series
resistance is minimal (~10% order).

3. Data based on design simulation only. Not tested in production.

- 1. The external capacitor protects the device against parasitic resets.
- The user must ensure that the level on the NRST pin can go below the V<sub>IL(NRST)</sub> max level specified in Table 56: NRST pin characteristics. Otherwise the reset will not be taken into account by the device.

# 6.3.16 12-bit ADC characteristics

Unless otherwise specified, the parameters given in *Table 57* are derived from tests performed under the conditions summarized in *Table 24: General operating conditions*.

Note: It is recommended to perform a calibration after each power-up.

 Table 57. ADC characteristics (continued)

1. During conversion of the sampled value (12.5 x ADC clock period), an additional consumption of 100  $\mu$ A on I<sub>DDA</sub> and 60  $\mu$ A on I<sub>DD</sub> should be taken into account.

2. Guaranteed by design, not tested in production.

3. Specified value includes only ADC timing. It does not include the latency of the register access.

4. This parameter specify latency for transfer of the conversion result to the ADC\_DR register. EOC flag is set at this time.

### Equation 1: R<sub>AIN</sub> max formula

$$R_{AIN} < \frac{T_{S}}{f_{ADC} \times C_{ADC} \times \ln(2^{N+2})} - R_{ADC}$$

The formula above (*Equation 1*) is used to determine the maximum external impedance allowed for an error below 1/4 of LSB. Here N = 12 (from 12-bit resolution).

| T <sub>s</sub> (cycles) | $T_{s} (cycles) 		 t_{S} (\mu s) 		 R_{AIN} \max (k\Omega)^{(1)}$ |      |  |  |  |  |  |  |
|-------------------------|---|------|--|--|--|--|--|--|
| 1.5                     | 0.11  | 0.4  |  |  |  |  |  |  |
| 7.5                     | 0.54  | 5.9  |  |  |  |  |  |  |
| 13.5                    | 0.96  | 11.4 |  |  |  |  |  |  |
| 28.5                    | 2.04  | 25.2 |  |  |  |  |  |  |
| 41.5                    | 2.96  | 37.2 |  |  |  |  |  |  |

1. ADC DC accuracy values are measured after internal calibration.

#### STM32F072x8 STM32F072xB

 ADC Accuracy vs. Negative Injection Current: Injecting negative current on any of the standard (non-robust) analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to standard analog pins which may potentially inject negative current. Any positive injection current within the limits specified for I<sub>INJ(PIN)</sub> and ΣI<sub>INJ(PIN)</sub> in Section 6.3.14 does not affect the ADC

accuracy.

- 3. Better performance may be achieved in restricted V<sub>DDA</sub>, frequency and temperature ranges.
- 4. Data based on characterization results, not tested in production.

#### Figure 26. ADC accuracy characteristics

# Figure 27. Typical connection diagram using the ADC

- 1. Refer to Table 57: ADC characteristics for the values of  $R_{AIN}$ ,  $R_{ADC}$  and  $C_{ADC}$ .
- C<sub>parasitic</sub> represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 7 pF). A high C<sub>parasitic</sub> value will downgrade conversion accuracy. To remedy this, f<sub>ADC</sub> should be reduced.

## **General PCB design guidelines**

Power supply decoupling should be performed as shown in *Figure 13: Power supply scheme*. The 10 nF capacitor should be ceramic (good quality) and it should be placed as close as possible to the chip.

| PSRR+ <sup>(1)</sup>                 | Power supply rejection ratio<br>(to V <sub>DDA</sub> ) (static DC<br>measurement   | -   | -67 | -40  | dB   | No R <sub>LOAD</sub> , C <sub>LOAD</sub> = 50 pF  |

1. Guaranteed by design, not tested in production.

2. The DAC is in "quiescent mode" when it keeps the value steady on the output so no dynamic consumption is involved.

3. Data based on characterization results, not tested in production.

 The DAC integrates an output buffer that can be used to reduce the output impedance and to drive external loads directly without the use of an external operational amplifier. The buffer can be bypassed by configuring the BOFFx bit in the DAC\_CR register.

Table 65. IWDG min/max timeout period at 40 kHz (LSI)<sup>(1)</sup>

 These timings are given for a 40 kHz clock but the microcontroller internal RC frequency can vary from 30 to 60 kHz. Moreover, given an exact RC oscillator frequency, the exact timings still depend on the phasing of the APB interface clock versus the LSI clock so that there is always a full RC period of uncertainty.

| Prescaler | WDGTB | Min timeout value | Max timeout value | Unit |
|-----------|-------|-------------------|-------------------|------|
| 1         | 0     | 0.0853            | 5.4613            |      |
| 2         | 1     | 0.1706            | 10.9226           | me   |
| 4         | 2     | 0.3413            | 21.8453           | ms   |
| 8         | 3     | 0.6826            | 43.6906           |      |

Table 66. WWDG min/max timeout value at 48 MHz (PCLK)

# 6.3.22 Communication interfaces

## I<sup>2</sup>C interface characteristics

The  $I^2C$  interface meets the timings requirements of the  $I^2C$ -bus specification and user manual rev. 03 for:

- Standard-mode (Sm): with a bit rate up to 100 kbit/s
- Fast-mode (Fm): with a bit rate up to 400 kbit/s
- Fast-mode Plus (Fm+): with a bit rate up to 1 Mbit/s.

The I<sup>2</sup>C timings requirements are guaranteed by design when the I2Cx peripheral is properly configured (refer to Reference manual).

The SDA and SCL I/O requirements are met with the following restrictions: the SDA and SCL I/O pins are not "true" open-drain. When configured as open-drain, the PMOS connected between the I/O pin and  $V_{DDIOx}$  is disabled, but is still present. Only FTf I/O pins support Fm+ low level output current maximum requirement. Refer to Section 6.3.14: I/O port characteristics for the I<sup>2</sup>C I/Os characteristics.

All I<sup>2</sup>C SDA and SCL I/Os embed an analog filter. Refer to the table below for the analog filter characteristics:

| Symbol          | Parameter  | Min               | Мах                | Unit |
|-----------------|--|-------------------|--------------------|------|
| t <sub>AF</sub> | Maximum width of spikes that are suppressed by the analog filter | 50 <sup>(2)</sup> | 260 <sup>(3)</sup> | ns   |

Table 67. I<sup>2</sup>C analog filter characteristics<sup>(1)</sup>

1. Guaranteed by design, not tested in production.

- 2. Spikes with widths below  $t_{AF(min)}$  are filtered.
- 3. Spikes with widths above  $t_{AF(max)}$  are not filtered

# SPI/I<sup>2</sup>S characteristics

Unless otherwise specified, the parameters given in *Table 68* for SPI or in *Table 69* for  $I^2S$  are derived from tests performed under the ambient temperature,  $f_{PCLKx}$  frequency and supply voltage conditions summarized in *Table 24: General operating conditions*.

Refer to Section 6.3.14: I/O port characteristics for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO for SPI and WS, CK, SD for I<sup>2</sup>S).

| Symbol                                       | Parameter                           | Conditions  | Min         | Max         | Unit   |

- 2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

### **USB** characteristics

The STM32F072x8/xB USB interface is fully compliant with the USB specification version 2.0 and is USB-IF certified (for Full-speed device operation).

| Symbol                              | Parameter                                      | Conditions              | Min.               | Тур  | Max. | Unit |
|-------------------------------------|--|-------------------------|--------------------|------|------|------|
| V <sub>DDIO2</sub>                  | USB transceiver operating voltage              | -                       | 3.0 <sup>(1)</sup> | -    | 3.6  | V    |
| t <sub>STARTUP</sub> <sup>(2)</sup> | USB transceiver startup time                   | -                       | -                  | -    | 1.0  | μs   |
| R <sub>PUI</sub>                    | Embedded USB_DP pull-up value during idle      | -                       | 1.1                | 1.26 | 1.5  | kΩ   |
| R <sub>PUR</sub>                    | Embedded USB_DP pull-up value during reception | -                       | 2.0                | 2.26 | 2.6  | Ν32  |
| Z <sub>DRV</sub> <sup>(2)</sup>     | Output driver impedance <sup>(3)</sup>         | Driving high<br>and low | 28                 | 40   | 44   | Ω    |

| Table 70. | USB | electrical | characteristics |
|-----------|-----|------------|-----------------|
|           |     |            |                 |

1. The STM32F072x8/xB USB functionality is ensured down to 2.7 V but not the full USB electrical characteristics which are degraded in the 2.7-to-3.0 V voltage range.

2. Guaranteed by design, not tested in production.

3. No external termination series resistors are required on USB\_DP (D+) and USB\_DM (D-); the matching impedance is already included in the embedded driver.

## CAN (controller area network) interface

Refer to Section 6.3.14: I/O port characteristics for more details on the input/output alternate function characteristics (CAN\_TX and CAN\_RX).

# 7 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK<sup>®</sup> packages, depending on their level of environmental compliance. ECOPACK<sup>®</sup> specifications, grade definitions and product status are available at: *www.st.com*. ECOPACK<sup>®</sup> is an ST trademark.

# 7.1 UFBGA100 package information

UFBGA100 is a 100-ball, 7 x 7 mm, 0.50 mm pitch, ultra-fine-profile ball grid array package.

| Stencil opening   | 0.280 mm  |  |  |
| Stencil thickness | Between 0.100 mm and 0.125 mm                                     |  |  |

### **Device marking**

The following figure gives an example of topside marking orientation versus pin 1 identifier location.

Other optional marking or inset/upset marks, which identify the parts throughout supply chain operations, are not indicated below.

 Parts marked as "ES", "E" or accompanied by an Engineering Sample notification letter, are not yet qualified and therefore not yet ready to be used in production and any consequences deriving from such usage will not be at ST charge. In no event, ST will be liable for any customer usage of these engineering samples in production. ST Quality has to be contacted prior to any decision to use these Engineering Samples to run qualification activity.

# 7.2 LQFP100 package information

LQFP100 is a100-pin, 14 x 14 mm low-profile quad flat package.

#### Figure 50. Recommended footprint for LQFP48 package

1. Dimensions are expressed in millimeters.

The following figure gives an example of topside marking orientation versus pin 1 identifier location.

Other optional marking or inset/upset marks, which identify the parts throughout supply chain operations, are not indicated below.

## 7.7 UFQFPN48 package information

UFQFPN48 is a 48-lead, 7x7 mm, 0.5 mm pitch, ultra-thin fine-pitch quad flat package.

1. Drawing is not to scale.

- 2. All leads/pads should also be soldered to the PCB to improve the lead/pad solder joint life.
- 3. There is an exposed die pad on the underside of the UFQFPN package. It is recommended to connect and solder this back-side pad to PCB ground.

### 7.8 Thermal characteristics

The maximum chip junction temperature (T<sub>J</sub>max) must never exceed the values given in *Table 24: General operating conditions*.

The maximum chip-junction temperature,  $T_J$  max, in degrees Celsius, may be calculated using the following equation:

$$T_J max = T_A max + (P_D max x \Theta_{JA})$$

Where:

- T<sub>A</sub> max is the maximum ambient temperature in °C,
- $\Theta_{JA}$  is the package junction-to-ambient thermal resistance, in °C/W,
- P<sub>D</sub> max is the sum of P<sub>INT</sub> max and P<sub>I/O</sub> max (P<sub>D</sub> max = P<sub>INT</sub> max + P<sub>I/O</sub>max),
- P<sub>INT</sub> max is the product of I<sub>DD</sub> and V<sub>DD</sub>, expressed in Watts. This is the maximum chip internal power.

P<sub>I/O</sub> max represents the maximum power dissipation on output pins where:

 $\mathsf{P}_{\mathsf{I}/\mathsf{O}} \max = \Sigma \; (\mathsf{V}_{\mathsf{OL}} \times \mathsf{I}_{\mathsf{OL}}) + \Sigma \; ((\mathsf{V}_{\mathsf{DDIOx}} - \mathsf{V}_{\mathsf{OH}}) \times \mathsf{I}_{\mathsf{OH}}),$ 

taking into account the actual V<sub>OL</sub> / I<sub>OL</sub> and V<sub>OH</sub> / I<sub>OH</sub> of the I/Os at low and high level in the application.

Table 80. Package thermal characteristics

#### 7.8.1 Reference document

JESD51-2 Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air). Available from www.jedec.org

#### 7.8.2 Selecting the product temperature range

When ordering the microcontroller, the temperature range is specified in the ordering information scheme shown in *Section 8: Ordering information*.

Each temperature range suffix corresponds to a specific guaranteed ambient temperature at maximum dissipation and, to a specific maximum junction temperature.

As applications do not commonly use the STM32F072x8/xB at maximum dissipation, it is useful to calculate the exact power consumption and junction temperature to determine which temperature range will be best suited to the application.

The following examples show how to calculate the temperature range needed for a given application.

#### **Example 1: High-performance application**

Assuming the following application conditions:

Maximum temperature  $T_{Amax}$  = 82 °C (measured according to JESD51-2),  $I_{DDmax}$  = 50 mA,  $V_{DD}$  = 3.5 V, maximum 20 I/Os used at the same time in output at low level with  $I_{OL}$  = 8 mA,  $V_{OL}$ = 0.4 V and maximum 8 I/Os used at the same time in output at low level with  $I_{OL}$  = 20 mA,  $V_{OL}$ = 1.3 V

P<sub>INTmax</sub> = 50 mA × 3.5 V= 175 mW

P<sub>IOmax</sub> = 20 × 8 mA × 0.4 V + 8 × 20 mA × 1.3 V = 272 mW

This gives:  $P_{INTmax}$  = 175 mW and  $P_{IOmax}$  = 272 mW:

P<sub>Dmax</sub>= 175 + 272 = 447 mW

Using the values obtained in *Table 80* T<sub>Jmax</sub> is calculated as follows:

For LQFP64, 45 °C/W

T<sub>Jmax</sub> = 82 °C + (45 °C/W × 447 mW) = 82 °C + 20.115 °C = 102.115 °C

This is within the range of the suffix 6 version parts ( $-40 < T_J < 105 \text{ °C}$ ).

In this case, parts must be ordered at least with the temperature range suffix 6 (see *Section 8: Ordering information*).

Note: With this given  $P_{Dmax}$  we can find the  $T_{Amax}$  allowed for a given device temperature range (order code suffix 6 or 7).

Suffix 6:  $T_{Amax} = T_{Jmax} - (45^{\circ}C/W \times 447 \text{ mW}) = 105\text{-}20.115 = 84.885 ^{\circ}C$ Suffix 7:  $T_{Amax} = T_{Jmax} - (45^{\circ}C/W \times 447 \text{ mW}) = 125\text{-}20.115 = 104.885 ^{\circ}C$ 

#### Example 2: High-temperature application

Using the same rules, it is possible to address applications that run at high temperatures with a low dissipation, as long as junction temperature  $T_J$  remains within the specified range.

Assuming the following application conditions:

Maximum temperature  $T_{Amax} = 100 \text{ °C}$  (measured according to JESD51-2),  $I_{DDmax} = 20 \text{ mA}$ ,  $V_{DD} = 3.5 \text{ V}$ , maximum 20 I/Os used at the same time in output at low level with  $I_{OL} = 8 \text{ mA}$ ,  $V_{OL} = 0.4 \text{ V}$   $P_{INTmax} = 20 \text{ mA} \times 3.5 \text{ V} = 70 \text{ mW}$   $P_{IOmax} = 20 \times 8 \text{ mA} \times 0.4 \text{ V} = 64 \text{ mW}$ This gives:  $P_{INTmax} = 70 \text{ mW}$  and  $P_{IOmax} = 64 \text{ mW}$ :  $P_{Dmax} = 70 + 64 = 134 \text{ mW}$ 

Thus: P<sub>Dmax</sub> = 134 mW

Using the values obtained in *Table 80*  $T_{Jmax}$  is calculated as follows:

- For LQFP64, 45 °C/W
- T<sub>Jmax</sub> = 100 °C + (45 °C/W × 134 mW) = 100 °C + 6.03 °C = 106.03 °C

This is above the range of the suffix 6 version parts ( $-40 < T_J < 105 \text{ °C}$ ).

In this case, parts must be ordered at least with the temperature range suffix 7 (see *Section 8: Ordering information*) unless we reduce the power dissipation in order to be able to use suffix 6 parts.

Refer to *Figure 55* to select the required temperature range (suffix 6 or 7) according to your temperature or power requirements.
